Fortunately, Mr Renton did not perceive the frown on the young doctor's face; neither did he notice his daughter's flushed cheeks, nor any of the subtle tokens of a disturbed moral atmosphere. He had news of his own to communicate, and that excited him, to the detriment of his faculty of observation.

'What a dreadful affair!' he exclaimed.

Madge thought of Philip's proposal; Philip thought of Madge's engagement, and both asked, 'What affair?' with more embarrassment than curiosity.

'That murder of the policemen down the river.'

'The murder!' They were both sufficiently curious now, and for once in his life Mr Renton had two attentive listeners. 'You know,' he explained, 'that a month ago the police escort took a load of gold and dust to the bank at Melbourne. I suppose they left most of it there; but they were bringing back a considerable sum in bank-notes to the miners up the country. Bank-notes are light, so there were only two men sent on the return journey.'

'I know all that,' said Philip, with a touch of impatience. 'We expected them to stop at Picton last night. When they didn't come, I concluded that the roads were bad, and that they had got along slower than they expected.'

'The roads were bad, and they could not reach Picton before nightfall; at least, so I suppose, for they camped about ten miles away on the bank of the river, and there they were found murdered this morning.'

'Who can have done it?'

'Some bushranger, I suppose. Of course the object was theft; all the notes are gone.'

'It won't profit the thief much, I fancy; for doubtless the numbers of the notes are set down in the bank at Melbourne; and as soon as he presents one he will be caught—that is, if he is rash enough to present it himself. If he gets

a dupe to do it for him, it may take a longer time, but not much: he is a fool as well as a rogue.'

'It is funny that we should not have heard of bushrangers being in the neighbourhood,' said Madge. 'Captain Frere was out all the night before last looking about on the route the policemen were to take, in order to make sure that all was right; and he told me the coast was clear. If there had been any dangerous characters about, he would have sent an escort to meet the men, I suppose.'

'Ah! the bushrangers must keep a better lookout than the police magistrate,' said Mr Renton. 'They have brought the bodies to the inn; and I suppose Captain Frere will hold an inquiry, though it is hardly likely that anything will come of it besides a verdict against "person or persons unknown."'

'To the inn!' exclaimed Philip with some irritation. 'I hope not; noise or excitement may injure my patient greatly, poor woman.'

'Oh, you have a patient at the inn,' remarked Madge, faintly piqued. 'Is the fair Miss Jenny ill?'

'Not she; Miss Jenny is the goddess Hygeia. But they have a guest there, a woman who has once been beautiful, but has, if one may judge by appearances, had a hard life. I suppose she was going up to the mines. But I know nothing about her, beyond the fact that she fainted after going out for a walk yesterday morning, and that she is now in a very weak and feverish condition.'

'Poor thing! Is she young?' asked Madge.

'Not very. About forty, I should think from her appearance. I think I ought to go and see her. The bustle may have injured her. Miss Jenny—I know her!—would go rushing up to the invalid's room to tell her of "the murder," as if it were really a great treat. Besides, they'll probably want me to diagnose the nature of these two poor fellows' wounds.'

So Philip, glad of the excuse for a graceful departure, went away, his sore heart—such is human nature, with its troubles balanced by strange and fantastic compensations—fretting him a little less because of the exciting news.

He went down to the inn, partly to see his patient, partly to ask if his services were to be called upon in connection with the inquiry on the murder of the two policemen. He was interested in the matter, and when one has a curiosity to gratify, it is well to have the excuse of official duties to justify its gratification. The innkeeper's daughter met him at the door. Her eyes were not dim, nor was her natural colour abated; but, nevertheless, when she saw Philip, she leant up against the doorpost and gasped out: 'O doctor, I am glad to see you. Isn't this a terrible business! It has made me quite faint.' For the goddess Hygeia, probably because she had never had a day's illness in her life, had a great ambition to be considered an invalid—a weakness which had become more pronounced since Dr Sewell came to Picton.

'The air will do you good, then,' said the doctor coolly, passing her with a nod.—'Is your father about? I want him to take me to see the poor fellows.'

'He is in the coach-house. They're there, and

father is with Captain Frere, who is looking at them.'

Philip Sewell was not particularly desirous of meeting Captain Frere at this moment; but having expressed a desire to see the bodies, he could hardly turn round in a moment and profess indifference to the matter; besides, it was inevitable, if any investigation of the murder was to be made, that the doctor and the magistrate should meet in connection with it.

He went to the coach-house, where the two dead men lay. They had been stalwart fellows, apparently of a more active habit than the blue-coated guardians of the peace at home—rough-riders, who could find their way across an almost trackless country, and perhaps were not very scrupulous whether they took a bushranger alive or dead—men who have no place in a fully civilised community, and in a semi-barbarous one are a protection or a terror to the inhabitants according as some chance wind of circumstance may move them towards good or evil; but brave men, who, having undertaken a task, discharge it at any cost. These two had died in the fulfilment of their duty, and apparently had died hard. The discharged pistol taken from the cold nerveless hand of one proved that he had tried, however vainly, to prevent the theft. It was just possible that the thief had got more than the bank-notes in that midnight robbery.

Dr Sewell nodded silently to the innkeeper and Captain Frere as he entered the coach-house. A scant greeting suffices for the living when we are in the presence of the dead, and besides, Philip was not in the mood to lavish courtesy on Madge Renton's lover. Madge Renton's lover! What on earth could she see in that withered old stick? Philip asked himself, eyeing the captain with vigorous disfavour. The contempt was decidedly unjust. Lewis Frere was a picturesque-looking, if not a handsome man. His face was indeed lined and weather-beaten, and his hair was decidedly thin at the temples; but his dark eyes had that melancholy look which has a certain attraction for girls who have never known trouble themselves; and his long silky pointed beard was in itself a feature, giving him something of the aspect of the high-bred gentlemen whose portraits Van Dyck painted for all time.

'This is a sad sight, doctor,' said the innkeeper, after Philip had looked silently at the bodies for a minute or two. 'These two poor fellows, full of health and strength only yesterday, and murdered last night when we were fast asleep in our beds!'

'Not quite,' said Philip, whose professional eye noted more than that of an ordinary observer.

'Not quite what? Not murdered?'

'O yes, murdered. But they were not murdered last night. From all appearances, I should judge that they have been dead more than twenty-four hours.'

'Nonsense! How can you tell that?' exclaimed Captain Frere sharply.

'Oh! the study of medical jurisprudence is not exactly a waste of time; one learns a good deal by it,' answered Philip, in a tone which, without obvious discourtesy, indicated the sentiment, 'Mind your own business, and don't interfere with mine.'—'These two men must have been killed the night before last,' he went on in a more

amiable tone; 'and, by-the-by, it's funny, as you were out on scout-duty that night, that you didn't see a sign of the murderer. He must have been somewhere in the neighbourhood.'

'I wasn't out the night before last,' said Frere, hastily; 'I was in my bed, like the rest of you.'

'I beg your pardon. It was Miss Renton who said you were out, and I took it for granted she had learned the fact from you.'

'Miss Renton is not my guardian.'

'No; but I took it for granted that as your *fiancée*, she did not speak without authority, or at least knowledge.'

Frere muttered an imprecation, which Philip took to be an expression of anger at his stupidity in thus abruptly announcing an engagement which was supposed to be still secret, and the words which the captain at last addressed to him—'You are a good gossip-monger, Dr Sewell'—confirmed the notion in his mind.

'I suppose I ought to apologise,' said Philip; 'but as a marriage is a thing for all the world to know, doubtless I am anticipating your announcement only by a very short time. I can only say that I hope you will be worthy of Miss Renton's love.—Now, Birch, I think I will go and see my patient. Her heart is weak, and this fuss and excitement in the house may have injured her.'

He went out; and Birch, turning to offer surprised congratulations to the captain, saw that he was very pale. 'You look bad, captain,' he exclaimed. 'This sight does make a man feel a bit queer. Come into the house and get a drop of brandy.'

'I confess I would be glad of it,' said Frere, and they left the coach-house. But the captain would not enter the inn. He threw himself down on a bench near the door, saying that the air revived him; and while Birch hurried away to bring the brandy, Miss Jenny, who was still leaning against the doorpost, pouting a little that the doctor had wasted so few words on her, entered into conversation with him.

'You do look ill, captain. Of course that sight would give you a turn; and you've got a cold too, haven't you?'

'No; I haven't. How could I catch cold?' he said irritably, as if the idea of a cold annoyed him.

'Oh, I don't know,' she returned, offended at his tone. 'But seeing you've had your throat wrapped for two days, it wasn't such a strange idea to get into my head, was it?' And she pointed to a silk handkerchief, which the captain wore folded closely around his neck.

Captain Frere had apparently recovered his temper. 'You're right, Miss Jenny,' he admitted; 'I have a cold; but you see I'm very touchy about confessing to such an old woman's complaint.'

Philip Sewell meanwhile was sitting holding his patient's wrist with his fingers on her pulse. He had been pleased to note when he first took it that it was calm and steady. But the voices of the two speakers outside floated up to the open window of the room where the unknown woman lay, and at the sound of the captain's, the pulse suddenly leapt into a quick fluttering irregular beat.

'Now, this is very funny,' said Philip to him-

self, preserving an immovable countenance the while. 'I wonder if it was Frere she came to Picton to see? It is evident that his vicinity excites her.'

SUN-DIALS AND HOURGLASSES.

EVERYBODY nowadays knows the value of time, and the necessity of marking its swift flight by clocks and watches of such exact work and measurement as to let not a single moment pass unnoted. We are far too busy and too clever to permit of any such neglect; yet, for all that, it may be doubted whether we are a whit more alive to the value of the golden hours than when many a workman good and true was content to mark their flight by the shadow of a homely Dial. 'Doubtless,' says honest old Izaak Walton, in one of his charming pages of the joys and pleasures of country life—'doubtless, the dweller among the quiet meads and streams may carry with him his well-contrived horologe, of silver or gold—yet as he wanders by the river-side, he will gladly note the rise and fall of day by the opening and shutting of flowers that deck the mead, or by the sweet music of the birds at morn or eve; by the shadow on the mossy dial, in the sunny garden of the farm, or hard by the tower of the village church.'

In his time, such dials were plentiful enough. Mr Pepys, in his *Diary* (1670) tells us of one in his famous garden at Clapham; while his friend, John Evelyn, talks still more pleasantly of the moss-grown dial, among his flowers at Sayes Court. They were, in fact, all the fashion among those who prided themselves on well-ordered gardens. We hear of them at Hampton Court and at Royal Windsor; as also, of a certain Nicholas Stone, who became so famous in designing and building them up—after many a quaint fashion—till the king employed him to set up one in the courtyard of the Palace of St James—which cost six pounds thirteen shillings and fourpence, exclusive of payment for stones and work; and of a still rarer and more elaborate dial in the private gardens at Whitehall, for which forty-six pounds were paid out of the royal pocket. They were known, too, long before these days of King James; and to say nothing of the famous one of Ahaz and Hezekiah, there is a mention of them in Homer (probably a contemporary of the prophet); while at a later date, when Rome was the great city of the world, among her many wonders was the huge sun-dial in the Campus Martius. Augustus, when he came in triumph from Egypt, had brought with him a towering Obelisk—a twin-brother, it may be, of Cleopatra's Needle—and set it up as the gnomon of a vast sun-dial among the stately arches and porticoes where the Roman citizens were wont to assemble at the public games. Round about it the hours were marked out by a circle of gigantic golden figures, so arranged that they might catch the earliest and latest rays of sunlight, and mark the dawn and close of day with a mighty bar of shadow.

But this, like many another wonder of the great city, has long since passed away; and not a trace of it but the obelisk is to be found. Century after century rolled by, and by degrees the custom of setting up dials in public places

fell into disuse, not to be revived until the time came for building Christian churches in widely scattered lands, and then by many a lonely village tower, where the Cross gave man hope of eternity, the shadow on the dial reminded him of the flight of time. And still, in many a quiet country churchyard, and in many a trim manor-house garden, there is yet to be found some quaint little memorial of bygone simple days, old-fashioned rustic folk—in the moss-grown dial, though the hands that framed it are now but dust. One such happy garden I know in the pleasant county of Sussex, where such a dial stands.

Not wholly in the busy world, nor quite
Beyond it, blooms the garden that I love.
News from the humming city comes to it
In sound of funeral or marriage bells;
And sitting muffled in dark leaves, you hear
The windy clanging of the minster clock.

The manor-house itself, round which the garden lies stretched, is a fair and stately mansion of ruddy tone, with many a quaint turret and pinnacle along its tall roof, and has for several generations borne the dainty name of Summer's Place, a title that well befits it, not merely because of the air of sunshine which welcomes all comers to the goodly house, but that the whole place is crowned and crowded with flowers. It abounds with winding paths, snatches of grassy lawn, clumps of rare shrubs and trees, and above all, with roses of every hue, and choicest fragrance. Follow the broad walk from the house, down between tall hedges of yew, and you come upon a little sunny open space; and there, in the midst of blooming flower-beds scattered over the soft, close-shaven, turf, stands the dial. Built after the simplest fashion, it has no pretence to any charm but that of being old-fashioned, and after the pattern of a still older one in another Sussex garden not far away. Round the four sides of the plate of the dial are cut the following four mottoes, each for its own season: After Darkness, Light; Alas! how swift. I warn whilst I move; So passes Life.

As you stand by the old dial, look where you will, the view is charming. All round lie wide open champaign, meadow, ruddy ploughed land, and sloping upland; dotted here and there with clumps of trees, gray old church towers, and goodly farmhouses, each nestling quietly down under the shade of wych-elm, as if it had been there for ever. Not, however, for so lasting a possession. For the proudest towers decay; 'All things do wax and wane,' 'The longest day must end,' and 'Tempus' is still 'edax rerum,' as many a dial still warns us.

'Time makes hay,' says the motto to the lazy Spaniard who relies on to-morrow; more practically to us English folk, 'Make hay while the sun shines'; for, says cheerful Master Herriek:

The glorious lamp of heaven, the Sun,
The higher he is going,
The sooner will his race be run,
And nearer he's to setting.

But among all the countless mottoes set up for dials, perhaps the wisest and wittiest is that which once stood in the old Temple Gardens, at the word of the great Lord Chancellor Bacon. He was hard at work in his chambers one day, when an idle student dropped in to ask his

lordship for a motto for the new sun-dial then being built. Twice, he humbly made his request; but the grave chancellor gave no reply or sign of having heard it. At last, as the petitioner began again for the third time, my lord looks up and says angrily: 'Sirrah, Be gone, about your business.'—'A thousand thanks, my lord,' replies the suitor; 'the very thing for the dial; nothing could be better.'

Yet, if this be the suggest of mottoes, and worthy of so grave a godfather, the brightest and happiest surely was that, once at Paul's Cross: 'Horas non numero nisi Serenas' (I number none but sunny hours); not only a word of warning to all comers, but of dainty reproof to the whole generation of grumblers and malcontents, who altogether leave the sunshine out of their daily record of things, and give us but a catalogue of cloud, dark days, and evil. Not so with the sun-dial. Not a gleam of sunshine, not a golden grain in Time's hourglass passes unnoted; and though the recording finger is a line of shadow, it tells of light—light that must wane, and time that is ever flying, and, once gone, is gone for ever. So much for to-day.

As for to-morrow, we all know the stern truth about it, and that in fact it may never be ours. The sages and moralists of all ages have told us, and warned us, so often that no texts are more common or less heeded. With one special one among these proverbs the wits have dared to take great liberties. 'Never put off till to-morrow,' said Grimaldi's mother to her witty son, 'what can be done to-day.'—'Very well, mother,' replies Joe; 'then let us have the plum-pudding to-night.' Clearly, he regarded to-morrow as a doubtful possession.

'This proverb about to-morrow,' says Talleyrand, is badly rendered; it ought to read thus: 'Never do to-day what you can possibly put off until to-morrow.' 'This plan,' says sage old Benjamin Franklin, 'I once tried for a month; but, easy as it seems, the plan was an utter failure, and at the end I suddenly found that to-morrow was always a day beyond my reach.'

But 'time flies,' as we linger among the wits, and there is but brief space for a few words on the second heading of this little paper, Hour-glasses, which, far more than sun-dials, are now all but things of the past; though time was, and that not so very far remote, when they were to be found in almost every parish church in the land. Here and there, as early as the third century, mention of them is to be found; and so onwards increasingly to the time of the Reformation, when one was usually set in the pulpit as a guide to the preacher. At Hurst, in Berkshire, one was set up with the legend: 'As this glass runneth, so fadeth man's life.' At St Dunstan's, Fleet Street, London, were once a couple of hourglasses, with fittings of silver which, in aftertimes of trouble, were melted down and made into heads for the beadle's staves. In the parish book of Saint Katharine's, Aldgate (1564), is an entry which runs thus: 'Item, for one hourglass hanging by pulpit where the preacher doth make his sermon, that he may know how the hour passeth, one shilling.'

An hour, or even less—for some glasses were made to run for half an hour—was then counted enough and more than enough both by priest

and people for the preacher's discourse; and the glass, in fact, was for warning him to get ready for Finis. But onward from Martin Luther's time the preacher's office grew to be more and more magnified; and in the days of the Puritan divines even two hours were not thought too much for a 'right godly admonition.' Hence it fell out at Hadleigh, where a certain Independent had come to take the place of a 'back-sliding' vicar, that on a special Sunday the preacher had already got through half of the second glass, and there appeared no sign of his coming to a conclusion. It was sultry summer weather, and the audience, one by one, were creeping out of church, when, at a sudden pause in the minister's discourse, up rose the old parish clerk, after long watching for a chance—'When your reverence,' said he, 'hath finished, be pleased, honoured sir, to close the church door and put the key under it.'

Those were the days when Hezekiah Poundtext had it all his own way, 'could go on for ever,' as Roger Wildrake profanely put it, 'and then begin again;' and when 'Finally, lastly, and to conclude' might be a long way off from the desired haven of Finis.

Indeed, if the preacher failed to make out his full hour, he was counted lazy, 'a slothful shepherd, a dumb dog,' an unprofitable member; and many a dull discourse passed muster by reason, mainly, of its intolerable length. Yet some of the lengthiest of these expounders were not without a grain of wit which, though grim enough in its way, helped to season the long-drawn, weary, outpouring with a spark of salt. Thus, one Hugh Peters, a well-known and lengthy expounder of knotty points, on a certain special occasion, finding at the end of the first hour that he was not half-way through his subject, cried out, as he turned the hourglass for another spell: 'Beloved, I know you to be right good fellows; so, let us have one more glass together before we part.' And small as it is, the joke seems to have been a favourite one: for much about the same time we find his friend and fellow-labourer, the notorious Daniel Burgess, making use of the very same image. He was preaching, at Westminster, on what would now be called the Total Abstinence question, and having thundered with great violence and at prodigious length against the perils, sin, and shame of 'Drink, drinking, and drunkards,' accursed, and 'to be accursed ever among Christian men,' the impartial hourglass suddenly ran down. Whereupon Daniel, calmly turning it, went boldly on: 'Brethren, of this damnable custom of drinking, there is yet more to be said, nay much more; let us then have the other glass, and then, if need be, another, &c.'

'If,' said honest old Martin Luther, 'I had my time to go over again, my sermons should be much shorter, and fit for children and poor folk, &c.' But having one's time over again is just what is in nobody's power; the very lesson which the learned Doctor himself had doubtless enforced in many a long discourse, of which, many a sundial, and many an hourglass had been warning him for half a century, and in vain, until in his old age he grew to be merciful, as he thought of how many people he had sent to sleep, when he meant to awaken them.

'Time,' says an Italian proverb, 'brings roses.'

'Time,' says another sage, of wider ambition, 'brings all things to them who wait.' Possibly so; if by 'all' we are content to mean 'a good many,' but not 'all' in any other sense; for not one of the wasted hours of the past, and not one of the lost opportunities and neglected duties that lie buried under them, may ever come back. Hogarth, when he drew his picture of 'The Sleeping Congregation,' meant more than a joke when he set up an hourglass before the preacher with the laughing scroll on it, 'Omnia funus erunt,' as an elegy of the past. As well try to gather the puff of smoke that has vanished into thin air, as to call back a grain of sand that has once fallen from the glass. It is a greater artist than Hogarth who in his own inimitable fashion sums up the whole truth in a single line:

And all our yesterdays have lighted fools
The way to dusty death.

OLD SALLY.

SHE was one of the accepted facts of my childhood, taken as a matter of course with the unquestioning stolidity of most children. It never struck me as strange that Sally's wrinkled countenance should be of a dark coffee colour when all the other faces round me were white; or that while she spoke in curious negro jargon, the other servants used broad Devon. I accepted her, and never speculated concerning her.

She was a relic of the days of West Indian slave-holding, and was born a slave, but gained her freedom by coming to England long before the days of the general emancipation. She never in the least realised the fact, being in her own opinion 'missus's' property; and she would have been much offended if any one had tried to prove the contrary. She came with missus (my grandmother) as her maid from her father's estate, and never left her: she died, crossing and recrossing the Atlantic several times in the discharge of her faithful service. She often told us, in the quaint negro jargon that never sounded strange in our ears, of those long monotonous voyages in the vast sailing-ships of the day. Of the constant watchfulness, for fear of privateers, and the sharp orders of the protecting frigates to 'close up' if any of the unwieldy merchantmen showed signs of straggling. Of the delighted relief which spread over every heart when the commanding officer signalled, 'Bonaparte is taken! Shift for yourselves!' Of how the ship in gaining port almost scraped sides with a great man-of-war outward bound; and passengers flew to the side and sailors to the rigging when it became known that the little man pacing the quarter-deck with folded arms and sorrowful face was 'Bony' himself on board the *Billy-ruffian*.

Her youth had been passed in earthquake-shaken Guiana. 'Dere it was hot, chillen! And de ground did walk and de ground did talk!' was her graphic account of the continuous earthquakes. Her anecdotes of her fellow-servants were full of contempt, and generally intended to point their inferiority to herself. When my great-grandfather, an easy soul, much ruled by his so-called slaves, died, he was succeeded by his son, a just but stern man. 'Ole massa were very kind, and young massa not bad; he gave us plenty roast beef, but he ran us troo wid de spit!'

I seem to see her now sitting in her own arm-chair, close to the window of the servants' hall, and leisurely darning granny's black silk stockings. She wore a turban of linen, stiffly starched, and nearly a foot high above her dark keen face. Her figure was spare and active, though her groans and complaints about her 'lumba-ager' were incessant. Her dress was a straight and scanty garment of either lilac print or black merino, with elbow sleeves and a coloured handkerchief pinned around her shoulders. In the morning she tied a gay bandana across her forehead, knotting it behind, Malay fashion; but her turban was the chief pride of her toilet, and she spent hours washing and starching the folds of white fine linen which composed it. A pair of spectacles were perched far down her nose—such spectacles! with round glasses and broad flat-silver rims. On the window-seat beside her, her Bible was generally spread open, and she mingled texts and apostrophes to 'de Lard' with groans about her 'lumba-ager' and constant admonitions to the 'chillen.'

The servants' hall was a paradise of delight to us. It contained a cupboard full of dusty toys, the playthings of children long grown up or dead and gone. There were rosy apples stored in rows on the top of the linen press; and a family of fascinating china cats on the mantel-shelf. The walls were papered with lilac roses on a buff ground, and the centre table covered with a cotton cloth of lively blue-and-red check. The old mulatto sat in her armchair, drawn close to the window, across which the Devon roses clambered, and a great bush of fuchsia touched the panes with its bright slender red blossoms. In the corner opposite Sally, 'Anne' generally sat, a faded plaintive little woman, with a light brown front artlessly arranged (how often I wondered why the skin of Anne's head grew in a ridge above her forehead!), and a chronic whitlow. Her 'front' was crowned by a high bandeau of gray blond, interspersed with bows of purple ribbon, and the back of her head was encased in a sort of black silk bag. She was the 'young ladies' maid' (my aunts were spinsters considerably over forty). She was as silent as Sally was voluble, and generally assented to her remarks in monosyllables. On the subject of theology alone these two friends disputed, and their contentions were sharp and bitter on such points. Each attended a different Bethesda, and considered her minister as the one unfailing, light, and her fellow-congregation the only elect hand-sure of ultimate salvation. 'I prove it you—I prove it you in de Word, Anne!' Sally would exclaim, slapping her Bible in great excitement. But Anne always held to her point with Saxon persistence and a depressed air.

Sally went to chapel every Sunday morning in great state, and we generally escorted her to the gate to see her start. She wore a black llama shawl, and a huge 'drawn' silk bonnet of tunnel-like depth, with deep borders of crimped muslin round her dark old face. She went slowly, leaning on a cane of ebony, mounted in silver; and in wet weather one of the younger maids held unfurled over her a green cotton umbrella with brass tips. Her bath-chair was drawn bodily by the owner himself, a mouldy man, with a bent back and a perspiring neck, of whom Sally entertained the lowest possible opinion, and always

spoke to him with a mixture of contempt and condescension on account of his making himself 'a beast of burden—no better dan a donkey.'—'It am a maracle to me how he does it,' she often remarked, with a coloured slave's instinctive wonder that even the meanest of mean whites could so debase himself.

In the discharge of her easy duties as personal attendant on my grandmother Sally was a very dragon, demanding an amount of attention for missus that that meek lady would never have dreamt of claiming for herself. Her daughters were sharply called to account if they failed to return anything borrowed from their mother. 'Now, Missy Lulu, where am my missus's boxes, and where am de straps and de bag dat you took away?' And 'Missy Lulu' (my Aunt Lucy, an untidy, short-sighted spinster of mature age) was obliged to search for and produce the missing articles under Sally's persistent inquisition.

My three aunts slept in two large communicating rooms, retaining the custom of their childish days. Sometimes my grandmother would send a message to them while dressing, and occasionally Sally found them all on their knees at their morning prayers. Regardless of the fact, she made her communication in a loud clear voice and departed. 'You must not do that, Sally,' my grandmother once urged mildly, after her daughters had complained to her of the old woman's irreverent disturbance of their devotions. 'You must wait until the young ladies have finished their prayers, and then speak.'

'Why mus' I wait?' returned Sally, much injured. 'It would interruekt your dressin'.'

'Never mind that, Sally; the delay will not hurt me.'

'Umph! 'Cause so dat de Lard am not dressin', and it cannot matter to Him dat one little minute dat de young ladies leave off 'peakin'.'

And in spite of her fervent and genuine piety, the old mulatto steadily refused to keep her mistress waiting even for 'de Lard.' In fact, she considered my grandmother to be a being apart and above considerations that weighed on other folks. I heard a friend, who was trying to combat some of her very brimstone theories concerning the hereafter, say to her, long after my grandmother's death: 'Why, Sally, according to that, only a few members of your own persuasion would be saved! Now, your mistress was a staunch Churchwoman, I know. What do you think about her?'

Sally drew up with an offended air. 'My missus had no call to tink of such things,' she said with conviction; 'she was better than the angels.'

The old woman had a Scotch dislike to answer any question that committed her to a direct assertion. I remember hearing my grandmother ask her one morning if 'Miss Lucy' had eaten an egg at breakfast. 'Can't say, missus; but I saw de shell,' she replied cautiously.—'Sally, are those clothes aired?' 'Can't say, missus; but I saw dem befo' de fire.'

As years went by, Sally had to abdicate her throne in the servants' hall, and cease her admonitions of the younger maids and 'Masse John's chillen.' She retired to her own room and nursed her lumba-ager by the fire, ruling the maid detailed to wait on her with a rod of iron.

She expected to receive daily visits from all the members of the family, and any visitors who might be staying in the house, and always upbraided any one who, she considered, had failed in this duty.

Quiet little Anne faded away long before the old mulatto, though she was much her junior. 'I trus' dat she hab foun' grace, dat Anne,' Sally remarked of her, shaking her turban mournfully. 'But I dunno. She just rampaged against grace, did dat Anne.' And she always referred to Anne as a person of fiery and headstrong temper, with whom she feared that her own meek ministrations had failed.

When 'my missus' died, the poor old woman's grief was painful to witness, and she scarcely left the body night or day till the funeral, sitting beside the bed while tears rolled down her withered cheeks. 'O my missus! My dear ole missus! What she do widout me? Why didn I go too!' she moaned, rocking herself to and fro, crouched in the shadow of the curtains, a very type of old-world service and devotion.

Lying awake one night not long before her death, her keen old ears—she was never the least deaf—caught the sound of movement in the house below. She rose; and arming herself with a flat candle-stick, popped on her head her discarded turban, and prepared to reconnoitre. She crept out, and peeped over the balustrade of the well staircase into the hall below. Dim forms with shaded lights were moving about softly. 'De wicked flecth when no man pursuoeth,' roared Sally, furiously at the sight, and banged her brass candlestick with an appalling clatter against the handrail. One of the marauders looking up, saw the dark face, white turban, and gleaming eyes of the mulatto. With a yell of terror he literally fulfilled her statement, taking to his heels with his companions behind him before they had had time even to secure the silver tops of the cruet-stand.

Sally had a touch of oriental magnificence in her nature, and never condescended to minute detail. Her linen she bought by the piece, not the yard, and made all her underclothes in 'sets' of a dozen, even beginning a new dozen when she must have been about ninety-five. Occasionally she would send a 'piece' of linen or calico print to importunate relatives in the West Indies, who often sent the quaintest begging letters to 'Aunt Sally,' and evidently considered her as a person of great wealth. Her wages were paid from the moment she first set foot in England till her death, more than seventy years after. She left all her savings to my aunts, and some curious old gold rings which had descended to her from her grandmother, to whom they had been given by her owner early in the eighteenth century. Sally always kept a missionary box in her room, adorned with a picture of a palm-tree and a kneeling negro of inky blackness, and expected contributions for the purpose of sending 'de Bible to de poor niggurs.' Having secured her sixpence or shilling, she would pass to more worldly matters, and loved to hear all the gossip, and the soldier and sailor stories of her younger male visitors, for whom she did not disguise her partiality.

'Now Mars' George!' she would chuckle till double with mirth, 'I know dat aren't quite true;

but it am bery funny. Oh, Mars' George, my lumba-ager am bery bad, bery bad. De Lard is bery mareful; but I cannot tink why He made de lumba-ager!—And did the Cappen say dat? Oh, Mars' George, what a whippin' you did want! Jus' like your poo' great-great uncle, who nebber "duck his shot," as A'miral Hood wrote my ole missus with his lef' hand jus' after battle. She did cry and kiss de letter!—You like him, Mars' George, always de pearstest limb!—Oh, my lumba-ager!—Well, good-bye, Mars' George. Don't you be lon' comin' to see ole Sally again.—Dat Cappen mus' hab been de blin'est fool!—Lard bress you, Mars' George!'

Sally died at the ripe age of ninety-seven, and we buried her in the same grave as 'dat Anne.' The years of their united service were nearly one hundred and fifty.

WEST-OF-IRELAND SUPERSTITIONS AND CUSTOMS.

THE railway has annihilated more than distance in the west of Ireland. Fairies and ghosts have vanished as rapidly as if they had been put to flight with a witch's wand. It would seem that truth is indeed stranger than fiction, and the marvellous is expelled by the more marvellous. Doubtless the steam-engine, with its train of carriages and wagons, dashing across the country in its headlong speed, has far surpassed anything conjured up by the most extravagant Celtic imagination. Be that as it may, a ghost, a fairy, or a witch will soon be as rare in the west of Ireland as the magnificent deer that once bounded over the plains of my native province.

The hill of Knockmaa, in the county of Galway, was the headquarters of the fairies of Connaught. They went forth thence to garrison the raths scattered over the country; from the raths they sallied out in companies and legions on the summer and autumn winds to perplex or frighten the belated traveller; and many a prank they played with the silly peasant who remained too long out at wake or fair. These were just the things to predispose him for a visit from the children of the air; the former made him drowsy enough to lie down on some grassy knoll and sleep a few hours before his day's work began; the latter had furnished him with spirits prolific enough to create a thousand phantasms. But the wake and the fair were occasions of experiences widely differing: he who came from the wake was 'moved with the concord of sweet sounds,' and was borne lightly through charming realms of romance; but he of the fair was hag-ridden and pulled and dragged through the long night; the briars and the brambles were stained with the blood of his torn hands, and the hedges were garnished with the shreds of his torn clothes.

One of the most beautiful of all the fairies has, alas! long since passed away. Tall, slim, graceful, with large dark lustrous eyes, she used to watch beside the stile, in the gloaming, for her comely peasant lover; and woe to the youth who gazed into the depths of her dreamy eyes! One gaze, and the spell was upon him, and he pined away till his spirit fled to the fairy region where his fairy love claimed him for her own.

There was a cure for hydrophobia, which was due to fairy kindness. One of the monks of

the old monastery of Ballintubber, in County Mayo, was one day out boating on a lake in the abbey grounds; a small black dog swam after the boat; the poor creature seemed exhausted and about to sink; the monk, pitying it, took it into the boat. It remained quiet for a while; then suddenly springing up, it bit its sympathetic friend and plunged again into the water. The poor monk soon grew ill; in his melancholy, he wandered out into the fields to bewail alone the sad mishap that threatened his young life with a terrible death. Casting his eyes wearily around, he saw a book lying before him in the grass; taking it up and opening it, he found therein a charm for the fell contagion. The charm became hereditary. When dying, he bequeathed it to one of his nearest relatives, who bequeathed it to another; and thus it was handed down through the lapse of centuries. I saw the last of the race that had the gift of the supposed charm, and certainly he had something about him of the weird appearance of those who are thought to be connected by some link with the mystic world.

But all the children of the air were not equally benevolent. There was one remarkable only for mischievous pranks and the nightly annoyance he gave to a quiet industrious family. This troublesome gentleman was known as the 'Buck o' the Mill.' The mill was a small rickety concern, and was owned or tenanted by Michael Conville. The miller, too, was a remarkable man; his head was a lumber-room of miscellaneous items of history and fiction, strangely and incongruously mixed. The history of Ireland and England, a knowledge of mechanics, a harmless smattering of the black art, a taste for medicine, and for profane and religious controversy, all found a place in Mick's roomy head. But the Buck o' the Mill did not indulge in learned discussions with Mick. He was a cowardly fellow; he never ventured his molestations in the open day, but always waited for the night, when he would tear the mortar off the walls and hurl it at the members of this inoffensive family. Nothing was 'too hot or too heavy' for him; every night, jugs, saucepans, glasses, kettles, and pots, tables and chairs, doors and windows, were clashed and banged. Still, Mick, to his credit be it spoken, did not give in; he stuck bravely to his mill; and the Buck, wearied with his fruitless efforts at eviction, at last disappeared.

With the exception of a little lingering witchcraft there is now but scant token of the marvellous creations of long ago. The blacksmith's anvil is the most potent spell-worker now. About twenty years since, a blacksmith went through the ceremony of 'turning the anvil,' and there came a fierce storm, which tumbled houses, tore up trees by the roots, and made strong men grow pale and pray. With the calm of the next day fear disappeared, and men laughed at the passing folly of believing that any son of Vulcan, even if aided by all the Cyclops, could raise such a storm. The ceremony of 'turning the anvil' is, according to an old smith, who may have been drawing on his imagination, performed as follows: The smith rises before the sun, goes naked to his forge, turns the anvil, and strikes it four or five terrific blows with his sledge. This he repeats for nine mornings, and then the desired result is produced. Happily, a strict fast of nine days is a *conditio*

sine quâ non, so there is nothing cheering or invigorating enough to make the performance of the ceremony easy or agreeable.

Taking oath upon a skull used to be a dreadfully solemn affair. I remember only one instance. A very fearless but very honest woman was accused of stealing. She was so indignant at the charge, she procured a skull, brought it with her to the chapel, and when the congregation came out, she produced the skull and 'cleared' herself. What gives sanction to this strange oath is the belief that the spirit to whom the skull belongs will haunt not only the perjurer but the family of the perjurer for generations.

Other strange things are done by the Western peasantry; but I should rather call them by the simple name of custom than by the less agreeable name of superstition. When a cow gets unwell, it is by no means an uncommon practice to devote it to Saint Martin. The ceremony is performed by letting a few drops of blood from the poor creature in honour of the saint. The cow so devoted cannot be sold or killed; if it recover, it would be dishonouring the saint to suffer it to die any but a natural death.

A custom that attends the last agonies of the dying is the strangest of all. In the moment of dissolution, the dying person is lifted from the bed and laid on a little straw spread over a coverlet on the floor. This is, I believe, still very generally done. I have been unable to ascertain why it is done.

The Western peasantry may have had strange ways, the disuse of which may be no disadvantage; a state, however, of original simplicity is not to be lamented, since to be in keeping with this age of enlightenment so often means to have learned its vices.

UNFORGOTTEN.

You stepped awhile outside with me;

The night was magical with stars,
And through the curtains fitfully

Came the last waltz's dying bars;

You paler than your dainty lace,

Or that camellia in your hair—

There seemed a spell upon the place,

And nothing but the night was there.

I knelt upon the garden-ground;

Caprice or pity made you stay;

But still my heart ran o'er and drowned

The foolish words I tried to say:

One moment, one, I held your hand,

Ah! fair cold hand! and made my moan;

And then I grew to understand

How men seek bread and find a stone.

But still that waltz is in my head,

Now high, now low, it ebbs and flows,

And still the stars are overhead,

And still I see your scentless rose:

The record rests within my soul

Like lines upon the granite traced;

Though no men's eyes behold the scroll,

It keeps its legend undefaced.

SOLEMN TRIFLING.

'It seems,' says Johnson in his *Life of Sir Thomas Browne*, 'to have been in all ages the pride of art to show how it could exalt the low and amplify the little.' To this ambition we perhaps owe the *Frogs of Homer*, the *Gnat and the Bees of Virgil*, the *Butterfly of Spenser*, and *Coleridge's lines to a young Ass*. Although the subject in each of these cases is comparatively trifling, the halo of genius is thrown around it, and we now regard it with more interest and infinitely more consideration than we otherwise should have done. If for no other reason, therefore, the ambition has been productive of great and lasting contributions to the world's literature, and mankind would doubtless have been richer if art had concerned itself more with exalting the low and less with amplifying the little. The result in the latter case is, indeed, simply ludicrous.

Isaac D'Israeli has an interesting chapter on some forms in which a love of amplifying trifles has found vent. From an early period a weakness was manifested for composing works in which one letter of the alphabet was omitted; and when the rage for this species of misdirected energy had somewhat subsided, it became fashionable to compose verses in the forms of hearts, wings, altars, &c.—a practice which, by the way, has been revived of late in America. Some grave trifler is said to have written one hundred sonnets on his mistress's eyebrows; while another composed a collection of poems on a flea. Quite as absurd, perhaps, were those who devoted their hair-splitting energies to less secular themes.

Most of these follies occurred at a period of the world's history when life was not taken so seriously as it now is, when elegance in little things was considered an essential part of the qualifications of a gentleman, and when, as Macaulay said of Horace Walpole, 'trifles were his serious business.' But we have still with us those whose conformation of mind is such that whatever is little seems to them great, and whatever is great seems to them little. Such people, if they are given to sober

reading, worry themselves to death almost over the authorship of the *Letters of Junius*, or the identity of the Man in the Iron Mask, and so altogether miss the true lessons of history, just as much as a reviewer misses the aim and spirit of a novel when he devotes his whole attention to hunting out purely literal errors, and to discovering whether the heroine's eyes are spoken of as blue in one volume and black in another. The one is a trifler just as much as the other, though Carlyle's refusal to read *Adam Bede* because an amazing ignorance of carpentry is displayed in the first chapter, may lend a certain authority to the reviewer's trifling. In other directions the disregard for proportion is equally as great.

Much has been said of the solemn trifling of the antiquary, who has often been held up as the personification of misdirected energy. A glance through the old volumes of the *Gentleman's Magazine* will show that much can be said to warrant such a conclusion. From them, Monk-barn's paper upon the inscription of *Celia Lelia*—a contribution which, as we all know, 'attracted considerable notice at the time'—can easily be paralleled, if not surpassed; and in the early issues of the *Annual Register* there are some stories which justify the boisterous fun in *Pickwick* when Mr Tupman makes 'that immortal discovery which has been the pride and boast of his friends and the envy of every antiquarian in this or any other country.' But, after all, Dryasdust is not the greatest offender in the art of magnifying trifles. Other learned men have surpassed his wildest freaks. If it be really necessary to select one particularly glaring example of solemn trifling, it might perhaps be difficult to cite a better instance than Bentley's ludicrous edition of Milton.

Parliamentary annals contain many instances of grave trifling. When Steele was returned for Boroughbridge, he wittily described the House of Commons as consisting very much of silent people oppressed by the choice of a great deal to say, and of eloquent people ignorant that what they said was nothing to the purpose. It was one of the

latter class who, during the debate on the Hares and Rabbits Bill, astounded the House by what was known at the time as the 'great egg theory.' Notwithstanding that the honourable member was promptly reminded that hares and rabbits do not lay eggs, he insisted on beginning with the egg; and begin with the egg he did, laying before the House a volume of encyclopædic lore remotely connected with the matter in hand. Another trifler, an Irish member, once confidentially informed the House that he had an uncle who regularly took six tumblers of whisky-toddy daily. This fact, he said, troubled him greatly; and as a proof of his solicitude for his uncle's welfare, he read a family correspondence delightful in itself, but which gained infinitely from the manner in which he delivered it. Another Irish member gladdened the heart of the Speaker by a description of the personal charms of a cousin of his.

Ludicrous as individual trifling often is, it is nothing as compared with collective trifling. Many a haggling Highway Board has talked for days and spent thousands of pounds over a few yards of land; and there is a tradition that the Convocation of Canterbury once debated for three-quarters of an hour whether a semicolon should not be substituted for a comma in a document which was under consideration—a subtle distinction which, in ninety-nine cases out of every hundred, would not in the least affect the sense. The collective wisdom of the House of Lords, too, was once bent for some little time to the task of discovering a definition of the word 'archbishop.' Best of all, however, is the following piece of solemn trifling, which is actually to be found in one of the volumes of the *Transactions* of the Royal Society of London: 'Procure an earthen pot or jar that will come on upon your head so as to cover it completely; cut two holes in it for the advantage of seeing; and then, fastening it about your neck with a bandage, take off your clothes and walk into the river where the [wild] ducks are. Take care to enter above them in the stream, and to stalk down in such a manner that only your head, thus covered with the pot, be above water, as if carried by the current, and they will only take the jar for something floating on the water. When you are among the thickest of them, take one by the legs and pull it under water, then seize upon another in the same manner, and so on till you have taken the whole covey; and then march out again!'

'Red-tapeism' also is responsible for many extraordinary instances of solemn trifling. One will suffice: it is quite a masterpiece in its way. In 1877 a Chancery clerk left with the Paymaster-general directions for the sale of a certain amount in consols, which sale should have taken place three days after the deposit of the notice. In the meantime, however, a letter was received, stating that the officials wished to see the principal of the firm with respect to the sale. On attending at the office, the clerk was informed that the printed order directing the sale did not accurately describe the account as it stood in the Paymaster-general's books. Will it be believed that the 'error' consisted in spelling 'honourable' without the *u*? In consequence of this absurdly trifling discrepancy, the order had to pass through

four departments to be set right, and the sale did not take place for more than a week.

'Trifles light as air' are 'confirmation strong as proofs of holy writ' to others than the jealous, and in most cases it is certainly unwise to underestimate the importance of them, since not a little of the world's wisdom is the result of attention in days gone by to apparent nothings. Still, it may fairly be questioned whether the world has not lost quite as much as it has gained by the undue prominence which has been given to them. Who can tell—to take one striking example—how the progress of the human mind has been retarded by the scholastic philosophy, the acutest disciples of which for more than one century debated such a question as this: 'When a hog is carried to market with a rope tied about its neck, which is held at the other end by a man, whether is the hog carried to market by the rope or the man?' In our own days, it is to be feared that many, like the dog in the fable, grasp the shadow and miss the substance; by a sort of mental obliquity such people magnify trifles until they assume, in their eyes, Brobdingnagian proportions, thus completely dwarfing things of far greater importance.

A DEAD RECKONING.

CHAPTER VII.

LEFT alone, Miss Primby mechanically reverted to her embroidery; but it is to be feared that her doing so was little better than a pretence. She bit her under-lip very hard to help her in controlling the nervous emotion which she had much ado not to give way to.

True to her promise, Clara was not more than a few minutes away. When she came back she looked paler than before, but her eyes were extraordinarily bright and luminous.

'Is he safe, Clara? Oh, tell me that he is safe!'

'I hope and trust so; more than that I cannot say. The police may arrive at any moment. You must try to look brave and unconcerned, aunty, dear. You need not speak unless you like, but leave everything to me.'

'Very well, dear. I know that I shall be too nervous to say a word.—But what are you going to tell the police?'

'I am going to deceive them.—But oh, aunty, aunty, surely in such a cause I shall be forgiven!'

Suddenly Margery's unkempt head was protruded through the archway. 'They've come, mum,' she said in a stage whisper.—'They've stuck three men in front of the house and two at the back.'

Mrs Brooke nodded, and the head vanished.

'Now, aunty,' said Clara, 'let us both try to look as if nothing was the matter.' So saying she sat down to the piano and began to play a waltz in a minor key.

Presently in came Bunce, looking very white and scared, carrying a salver with a card on it.

Mrs Brooke took the card and read aloud: "'Mr J. Drumley, Superintendent of Police.'"—What can he want here at this hour of the evening?' she said.—'You had better show him in, Bunce.' And with that she resumed her playing.

She ceased playing, however, when the *portière* was pushed aside and two men came forward, one a little in advance of the other.

As Mrs Brooke rose and confronted them, the first man made a stiff military bow, while the second carried a couple of fingers to his forehead.

'To what may I attribute the honour of this visit?' asked Clara in her most gracious tones.

Both the men were evidently disconcerted. This pale beautiful apparition with its great shining eyes was something they had not expected to meet.

'You are Mrs Brooke, I suppose, ma'am?' said the first man after an awkward pause.

Clara smiled assent.

'I am Superintendent Drumley of the King's Harold police, and this is one of my sergeants. But our business is with Mr Brooke, and not with you, ma'am.'

'Quite so. But I hope your errand is not an unpleasant one?'

'I am sorry to say it is a very unpleasant one.'

'May I ask the nature of it?'

'If you will excuse me, ma'am, I would rather not enter into particulars—at least not just now. As I said before, our business is with Mr Brooke. May I ask whether he is at home?'

'He is *not* at home,' answered Clara. 'It is a pity you did not arrive a little earlier.' She consulted her watch. 'My husband left home about five-and-twenty minutes ago. His intention was to walk across the fields to Woodberry Station and catch the up-train to London.'

The two men stared at each other for a moment or two and then began to talk in eager whispers. Clara, who was close by the piano, turned over a leaf of music and struck a chord or two in an absent-minded way.

In rushed Margery, panting once more, and to all appearance breathless. She made-believe not to see the two constables. 'O mum,' she cried, 'what do you think? He let me carry his bag all the way through the park, and at the gate he gave me a bright new sixpence. I wanted to carry it to the station; but he wouldn't let me. I wish he had—he'd got more'n a mile to walk. But a new silver sixpence! O crumbs!' Margery ended with one of her most eldritch and uncanny laughs. The sergeant of police, who was rather a nervous man, jumped in his shoes; he had never heard anything like it before.

For a moment Mrs Brooke stared at the girl in blank astonishment; then a look flashed from Margery's eyes into hers and she understood.

'Of whom are you speaking, girl?' asked Drumley sternly.

'O lor! I didn't see you, sir.—Why, who should I be speaking of but Muster Geril?'

'She refers to my husband, Mr Gerald Brooke,' remarked Clara.

The two men retired down the room a little way and talked together in low tones. 'I ain't so sure that this is anything more than a clever dodge,' said Drumley, 'and that the gent we want isn't still somewhere about. However, you had better take Tomlinson with you and drive as hard as you can to Woodberry Station. The London train will be gone before you get there; but you can set the telephone to work and make

whatever inquiries you may think necessary. You've got the description?'—The sergeant nodded.—'Of course you've got to bear in mind that he may be disguised. Do the best you can, and then hurry back.—Send Simcox to me. I'll have the house thoroughly searched while you are away.'

The man saluted and went; and presently Simcox appeared in his stead.

Drumley drew a little nearer Mrs Brooke. 'Without wishing in the least, ma'am, to doubt that you have told me about Mr Brooke's departure,' he said, 'I consider it my duty to search the premises.'

The piece of music Clara was holding fell to the ground. 'To search the premises!' she exclaimed as she stooped to pick it up. She deliberately replaced the music on the piano before she spoke again. Then turning to Drumley with her most dignified air, she said: 'You forget, sir, that you have not yet enlightened me as to the nature of your business at Beechley Towers.'

'It is my painful duty to inform you, ma'am, that the Baron von Rosenberg was murdered this afternoon in his own grounds at Beaulieu.'

'Murdered! The Baron von Rosenberg!' exclaimed both the ladies in a breath.

'O aunty, that was a capital bit of make-believe on your part!' thought Clara to herself. Then, after a pause, to Drumley: 'We are excessively shocked, sir, at your tidings. The Baron was a visitor at the Towers, and was highly esteemed both by my husband and myself. Still, you must excuse me for saying that I fail to see in what way this dreadful tragedy connects itself with Mr Brooke.'

'It's a very disagreeable thing for me to have to break it to you, ma'am; but the fact is that Mr Brooke is suspected of having shot the Baron. The evidence against him is very strong, and—and, in fact, I hold a warrant for his arrest.'

'A warrant for the arrest of—my husband! You must be dreaming—or—or'—

'Not at all, ma'am. As I said before, the evidence against Mr Brooke—circumstantial, of course—is very strong. If you would like to see the document'—

'I will take your word for it.—My husband the murderer of the Baron von Rosenberg! Impossible! There is some incomprehensible mistake somewhere.'

'I hope so, with all my heart,' answered the superintendent drily. 'Still, I have my duty to perform.'

'Of course. I don't blame you for one moment; I only say there is a grievous mistake somewhere. You wish to go over the house—I think that is what I understood you to imply?'

'By your leave, ma'am.'

Without another word Mrs Brooke rang the bell; then, crossing the room, with her own hands she drew aside the *portière* that shrouded the archway and fastened it back by means of a silver chain. The hall beyond was now lighted up by three or four lamps which shed a chastened radiance over the scene. More lamps lighted up the gallery. The portraits of the dead and gone Croftons, male and female, seemed to have retired further into the solitude of their frames, as though the lamplight were distasteful to them. The leaves of the tropical plants massed here and

there shone glossy green; in that softened sheen the helmets and cuirasses of the men-at-arms who kept watch and ward at the foot of the staircase gleamed like burnished silver.

'Bunce,' said Mrs Brooke, when that functionary responded to the summons, 'you will be good enough to take a light and show these gentlemen over the whole of the house. You will allow them to enter every room without exception that they may wish to examine. Nothing must be kept back from them.' She made a little bow to Mr Drumley, as dismissing him and his companion, and then composedly re-entered the room.

'Hang me, if I ain't half inclined to think she's humbugging me, after all!' said Mr Drumley to himself as he followed the majordomo.

Oh, the slow exquisite torture of the half-hour that followed, which seemed, indeed, to lengthen itself out to several hours. To this day, Clara never thinks of it without a shudder. From where she was seated she could see straight across the hall to the staircase beyond; no one could go up or come down without her cognisance.

'Clara, dear, I had no idea you had half so much nerve,' said Miss Primby in a whisper.

'Don't speak to me, aunty, please,' she whispered back, 'or I shall break down.' Then to herself: 'Will this torture never come to an end!'

It did come to an end by-and-by. Mr Drumley and his man, preceded by Bunce, came slowly down the staircase. They were met in the hall by two other men who had searched the ground-floor and cellars. It was evident that in both cases their perquisition had been unsuccessful.

A minute or two later in marched the sergeant. His journey to the station had been equally fruitless of results, except in so far as setting the telegraph to work was concerned.

Mrs Brooke went forward to the group where they stood in the centre of the hall. 'Well?' she said interrogatively and with a faint smile. 'Have you succeeded in finding Mr Brooke?'

'No, ma'am; I am bound to say that we have not.'

'I hope you have not forgotten what I told you when you first asked for him,' was the quiet reply. 'But can I not offer you a little refreshment after your arduous duties?'

Mr Drumley laughed the laugh of discomfiture. 'I think not, Mrs Brooke—much obliged to you, all the same.—Come, lads; it's no use wasting our time here any longer.—Mrs Brooke, ma'am, I had a very disagreeable duty to perform; I trust you will bear me out in saying that I have tried to carry it out with as little annoyance to you as possible.'

'You have been most considerate, Mr Drumley, and my thanks are due to you.'

A minute later the men were gone. Then Mrs Brooke rang the bell and ordered all the lamps in the hall except one to be extinguished: that one but served, as it were, to make the darkness visible. No sooner was this done and the servant gone, than Margery once more put in an appearance.

'They're gone, an'm, every man-jack of 'em; and ain't Muster Drummle in a rare wax 'cos he couldn't find Muster Geril!'

Scarcely had the girl finished speaking, when

one of the men in armour at the foot of the staircase stepped down from his pedestal and came slowly forward. Margery fell back with a cry of terror, for not even she had been in the secret.

But Clara, rushing to her husband, pushed up his visor and clasped him in her arms. 'Saved! saved!' she cried in a voice choked with the emotion she could no longer restrain.

'For a little while, my darling, perchance only for a little while,' was the mournful response.

CHAPTER VIII.

We are at Linden Villa, a pretty little detached house, standing in its own grounds, in one of the north-western suburbs of London, and the time is the morning of the day after the murder of the Baron von Rosenberg. Two people are seated at breakfast—George Crofton and his wife Stephanie. For, Mr Crofton's protestations and oburgations notwithstanding at the interview between himself and Clara Brooke, he had thought fit within a month after that date to make an offer of his hand and heart to Mademoiselle Stephanie Lagrange, an offer which had been duly accepted. And, in truth, the ex-queen of the *Haute Ecole* was a far more suitable wife for a man like George Crofton than Clara Brooke could possibly have been.

Mr Crofton presented a somewhat seedy appearance this morning; there was a worn look about his eyes, and his hand was scarcely as steady as it might have been. His breakfast consisted of a tumbler of brandy-and-soda and a rusk: it was his usual matutinal repast. Mrs Crofton, who was one of those persons who are always blessed with a hearty appetite, having disposed of her cutlet and her egg, was now leaning back in an easy-chair, feeding a green and gold parakeet with tiny lumps of sugar, and sipping at her chocolate between times. She was attired in a loose morning wrapper of quilted pale blue satin, with a quantity of soft lace round her throat, and looked exceedingly handsome.

'Steph, I think I have told you before,' said Mr Crofton in a grumbling tone, 'that I don't care to have any of your old circus acquaintances calling upon you here. I thought you had broken off the connection for good when you became my wife.'

'Que voulez-vous, cher enfant?' answered Steph without the least trace of temper. 'You introduce me to no society; you scarcely ever take me anywhere; four or five times a week you don't get home till past midnight—this morning it was three o'clock when you crept up-stairs as quietly as a burglar. What would you have?'

George Crofton moved uneasily in his chair, but did not reply. 'Besides,' resumed his wife, 'it was only dear old Euphrosyne Smith who came to see me. She looks eighteen when she is on the *corde*, but she's thirty-four if she's a day. I've known her for five years, and many a little kindness she has done me. And then, although, of course, I shall never want to go back to the old life, I must say that I like to hear about it now and again and to know how everybody is getting on. Can you wonder at it, now that you leave me so much alone?'

'For all that, Steph, I wish you would break off the connection.' Then, after a pause: 'I

know that of late I have seemed to neglect you a little; but if I have done so, it has been as much for your sake as my own.'

'Ah, yes, I know. cards, cards, always cards.'

'What would you have?—as a certain person sometimes says. I know a little about cards; I know nothing about anything else that will bring grist to the mill. I bought my experience in the dearest of all schools, and if I try to profit by it, who shall blame me?'

'Which means, that you are teaching others to buy their experience in the same way.'

'Why not?' he answered with a laugh. 'It is a law of the universe that one set of creatures shall prey on another. I was very nice picking for the kites once on a time; now I am a kite myself. The law of metempsychosis in such cases is a very curious one.'

'I don't know what you mean when you make use of such outlandish words,' said Stephanie with a pout.

'So much the better; learned women are an abomination.'

At this juncture a servant brought in the morning papers. Crofton seized one of them, a sporting journal, and pushed the other across the table. He was deep in the mysteries of the latest odds, when a low cry from his wife caused him to glance sharply at her. 'What's up now, Steph?' he asked. 'It would be a libel to say you had touched the rouge-pot this morning, because there isn't a bit of colour in your cheeks.'

'What is the name of that place in the country where your uncle used to live?' she asked.

'Beechley Towers.'

'And the name of that cousin to whom your uncle left his property?'

'Gerald Brooke—confound him!—But why do you ask?'

For sole reply she handed him the newspaper, marking a certain passage with her finger as she did so. If Mrs Crofton was startled by something which caught her eye in the paper, her feelings were as nothing in comparison with those of her husband as his keen glance took in the purport of the paragraph in question. It was, in fact, little more than a paragraph in the form of a brief telegram, forwarded at a late hour by a country correspondent.

What the public were told in the telegram was that the Baron von Rosenberg had been found in his own grounds, shot through the heart, about seven o'clock in the evening; that strong circumstantial evidence pointed to the supposition that Mr Gerald Brooke, a near neighbour of the Baron, was the murderer; that he had disappeared immediately after the perpetration of the crime, and that, although he was still at large, the police had little doubt they would succeed in arresting him in the course of the next few hours.

For a little while, speech seemed powerless to express a tithe of what George Crofton felt when the words of the telegram had burned themselves into his brain. What a sea of conflicting emotions surged round his heart as his mind drank in the full purport of the message and all the possibilities therein implied! What a vista of the future it opened out!

'A little rouge, *mon cher*, would improve your complexion,' said his wife at length, who had been

watching him curiously out of her half-veiled eyes. 'If one were to judge by your looks, you might have committed the crime yourself.'

Her words seemed to rouse him. 'Stephanie, the day of my revenge is dawning at last!' He ground out the words between his set teeth. 'This Gerald Brooke—this well-beloved cousin of mine—is the man who came between my uncle and me and defrauded me out of my inheritance.'

'And the man who robbed you of the woman you loved, whom you hoped one day to make your wife.'

'How do you know that?' he gasped. 'I never said a syllable to you about it.'

'It matters not how I know it, so long as I do know it,' she answered, looking him steadily in the face as she did so, and beginning to tap her teeth with her long pointed nails.

'Well, whoever told you, told you no more than the truth. I did love Clara Danby, and I hoped to make her my wife. But all that was past and gone long before I met you.'

She did not reply, but only went on tapping her teeth the more.

'Putting aside my own feelings towards Brooke,' went on Crofton presently, 'who has done me all the harm that one man could possibly do to another, don't you see that if he should be arrested and found guilty of this crime, what a vast difference it would make in your fortunes and mine?'

'Expliquez-vous, s'il vous plait.'

'Should Gerald Brooke die without issue, by the terms of my uncle's will Beechley Towers and all the estates pertaining to it, including a rent-roll of close on six thousand a year, come absolutely to me—to me—comprenez-vous? Ah, what a sweet revenge mine will be!'

'Yes; I should think it would be rather nice to live at a grand place like Beechley Towers and have an income of six thousand a year,' answered Mrs Crofton quietly. 'So, if this cousin of yours is really guilty, let us hope for our own sakes that he will be duly caught and hanged.'

Crofton turned to the table, and having poured out nearly half a tumbler of brandy, he drank it off at a draught. Excitement had so far unnerved him that the glass rattled against his teeth as he drank.

'But what could possibly induce a man in Mr Brooke's position to commit such a crime?' asked Stephanie presently.

'That's more than we know at present; we must wait for further particulars.—By the way, I wonder who and what the murdered man was? The Baron von Rosenberg they called him. I never heard the name before.'

'I knew the Baron von Rosenberg some years ago—in Paris,' answered Stephanie with just a trace of heightened colour in her cheeks. 'He was a man between forty and fifty years old, and said to be very rich.—I never liked him. Indeed, I may say that I had every reason to hate him. And now he's dead! C'est bien—c'est très bien.'

Her husband was only half heeding her. 'Stephanie,' he said, 'I never hated any one as I hate that man. Should the evidence at the inquest, which will no doubt be held in the course of to-day, go to prove, or go far to prove, that Brooke is the assassin, and should the police not

succeed in arresting him in the course of the next forty-eight hours, do you know what I have made up my mind to do?"

"How is it possible that I should know?"

"I have made up my mind not to trust to what the regular police may or may not be able to do in this matter, but to employ a private detective on my own account. I happen to be acquainted with a man who is nothing less than a sleuth-hound in such a case as this. He has succeeded more than once when Scotland Yard has failed ignominiously. His services I shall secure; and if it cost me the last sovereign I have in the world, I will do all that man can do to bring Gerald Brooke to the bar of justice."

He spoke with a concentrated malignity of purpose such as he had never exhibited in his wife's presence before. There was an eager, cruel gleam in his eyes, like that of some carnivorous animal which scents its prey from afar. He set his teeth hard when he had done speaking, so that the gash in his lip showed with startling distinctness, and leant to his features an unmistakably wolfish expression.

Stephanie looked at him and wondered. She had flattered herself, as many wives do, that she had read and thoroughly understood her husband; but in this man there were evidently smouldering volcanic forces which might burst into activity at any moment, chained tempests of rage and ferocity which might not always be kept in check, the existence of which she had never suspected before. From that day forward, although her husband knew it not, she regarded him with somewhat different eyes.

He rose abruptly and rang the bell. "Let a hansom be fetched at once," he said to the servant.

"For what purpose do you require a hansom?" asked his wife.

"To drive me to the terminus. I shall go down to King's Harold by the first train. I want to hear for myself the evidence at the inquest on the Baron von Rosenberg."

SARDINIA AND THE SARDES.

BY CHARLES EDWARDS.

SARDINIA is by no means popular touring-ground, although it is situated near France, Italy, and Spain, and is in constant communication with many Levantine seaports. It is not easy to say why it is thus neglected. The proverb about the dog and its bad name has here perhaps some parallel application. In Julius Cæsar's time, Sardinia was reviled and doubly reviled by Cicero and many another Roman, who did but follow the fashion in this respect, and had never set foot in the island. And in our day it is equally the fashion to condemn it for its fevers, the tameness of its scenery, and its barbaric condition, upon grounds no less unfair.

Now, a hundred years ago, it is probable that Sardinia could really have matched any country in Europe for its barbarism. The feudal system was then still in force in the island, nor was it totally abolished by government until 1856. A rich baron walking in his fields and feeling tired would think nothing of calling to one of his labourers and bidding him make himself into

a bench by going on all-fours for his lordship to sit upon. Brigands defied the authorities, and lived, married, and died at their ease in a state of outlawry, leaving their male children to follow in their steps. Their mode of life was esteemed so much more honourable than the slow tedium of honest agricultural life, that the average Sarde maiden preferred to have a bandit for a husband. The Sardes were then full to the throat of the most grotesque and even horrible superstitions. In times of trouble they sacrificed hens in sequestered places to propitiate the saints; precisely after the manner of their Pagan forefathers when these on the like occasions appealed to their heathen gods. Much more detestable habits had then only in comparatively recent times been abandoned and interdicted. It is notorious that it was customary in Sardinia for sons to put their parents to death when they were old; for it was esteemed an absurd thing that a man in his dotage should drag on existence at a time of life when he is readily seduced into roguery and misconduct. Such was their very singular view of the matter! And, incredible as it may seem, even in the last century there were Sarde sons who upon this pretext deprived their sires of life and did it with impunity.

But a century has made an immense difference in Sardinia. Those strong factors in the enlightenment of a people, good roads, now traverse the island in all directions. They even ascend about four thousand feet high into the mountains of Barbagia, winding circuitously round the long thighs of the greater peaks, viewed from which they have the appearance of so many broad white ribbons, linking plateau to plateau. Bold indeed are the brigands who exist in the face of good roads, or close is the intimacy between them and the local police. But in Sardinia there is no such intimacy. The 'gendarmérie' are fine fellows. One meets them everywhere about the island: between village and village, on the plains, and riding guily through the umbrageous cork-woods of the interior, miles away from human habitations. For obvious reasons, they always go in couples; and their martial bearing pleases the eye as much as the consciousness of their presence is a solace to the mind.

In fact, it is in Sardinia as it is in Corsica: what goes by the name of brigandage is as a rule rather the result of the vendetta. But even the vendetta spirit is here far less vigorous than it was fifty years ago, when, in the Barbagia district, the annual mortality from this cause alone was one in two hundred and seventy-nine; and the man who died in his bed disgraced himself and his relations.

Yet it must be confessed that to the eye the Sarde mountaineers are ideal banditti. Their long greasy black hair, their hard faces, corrugated with wrinkles, their guns and long knives, quite apart from their attire of sheepskins, worn with the wool outside (the *mastruca*), the Phrygian cap, and their sly expression—all suggest an unorthodox form of livelihood. But the poor fellows live laboriously enough, in spite of the braggish air of their guns, which, by-the-by, are sometimes very singular weapons, inlaid with silver and ivory, and of great antiquity. Maybe they have been at work for twelve hours of the day felling timber on the steeper

slopes and burning it to charcoal. The gun is for a wild boar or a deer, if they chance to meet either or both on their way home. If they come across a stranger like the writer among their solitudes, they are glad to drink from his gourd, giving him at the time a gruff 'Salutè,' and afterwards a hearty 'Bon viaggio!' Naturally, they are curious about his personality. But no sooner do they understand that he is from the continent or 'terra firma'—as they call Italy and the whole world outside their island—than they assume that he is an 'engineer'; that is, a mining engineer, in search of mineral. They cannot be coaxed to imagine that any other kind of mortal would come among them. The writer believes he was regarded as a harmless kind of madman by all the more intelligent natives of the two or three villages in the neighbourhood of Sardinia's highest peak, when it transpired that he was not an engineer, and that he intended to climb the mountain for æsthetic purposes solely.

The character of the Sardes has ever been a puzzle to other Europeans. After but a few weeks' acquaintance, we are mystified by them. They have drawn their disposition from so many different sources, that there is no saying what characteristic predominates in them. The guide who was our companion for several days in Barbagia—a reputable man of high standing, and a graybeard, was alternately obsequious, haughty, insolent, very sensitive, most careful of our interests, eager to plunder us: now cordial, now vindictive, and now insincere. Like most of his fellow-countrymen, he was a great wine-bibber. In the course of our travels he fell ill, and we did all we could for him. But he was not at all grateful; and when our journeying was at an end, he requited us by demanding twice the sum of money we had beforehand agreed to pay him for his services, and by showering maledictions and menaces upon us until we left him to himself.

We do not think this man was an uncommon type of Sarde. In Roman times, when thousands of the islanders were sent yearly to Rome in chains, the saying, 'Sardes to sell!' was current as much because of the intractable and difficult nature of the people—which made them an unmarketable commodity—as because of the abundance of such captives offered for sale. The few English who are settled in Sardinia as mining engineers dislike their workmen. The Italians who cross the water, also to work in the mines, detest their comrades. 'Tutti traditori!' said one of the latter to us, in talking about them. 'They are a treacherous lot!' and he wished himself again in Calabria, which, one would suppose, does not rear the most trustworthy people in the world.

One may form some idea of national character from the way in which individuals of the nation treat their animal, assuming, of course, that such treatment is not solely regulated by religious injunctions. Well, strange to say, the Sardes seem to have little or none of that tenderness, and even affection, for their horses which one might expect from the Moorish blood in their veins. Much is implied in a name. An Englishman would as soon think of leaving his child unchristened as his horse. In Sardinia, however, the term 'horse' or 'mare' is the distinctive name given to these good beasts.

If religious festivals make a people religious, the Sardes are among the most religious of nations. Seldom did we enter a town or village without finding the place either in the midst of a festa, anticipating a coming festa, or discussing the festa just ended. Scattered over the island are a multitude of small chapels, dedicated to obscure saints, and to which the villagers for miles round flock with provisions and bedding once or twice a year. They camp out in the open or sleep in adjacent caves: a priest says mass in their midst; and they all eat and drink as if they had never before had a good meal, or as if the rest of their lives was to be one long fast. A disagreeable litter of ox bones, ribs of sheep, orange-peel, bean-skins, and stones of olives, strewn amid the grass near the hermitage, or on the level earth at the very church door, bears constant witness to the traveller of this sort of religious junketing up and down the land. The following statistics of food consumed at a traditional gathering, merely to celebrate the ordination of a priest in the district of Mamojada, shadows forth the magnitude of the Sarde festas in general. Two thousand five hundred people were present, and between them they ate twenty-two cows; twenty-six calves; twenty-eight deer and wild-boars; seven hundred and forty sheep; three hundred lambs, kiddings, and sucking-pigs; six hundred fowls; sixty-five measures—of what size indeterminate—of sugar; fifty pounds of pepper and spices; two hundred and eighty measures of corn; a hundredweight of rice; a hundredweight of dates; fifty sugared cakes; three thousand eggs; twenty-five large barrels of wine; three thousand fish; and a vast quantity of confectionery.

Until one gets well into the mountains, the scenery of Sardinia is somewhat disappointing. Its broad western flats, green enough in spring, but a parched dun colour under the summer skies, are far from thrilling. They are good for the railway, which runs down the length of the island; and for that reason, the traveller sees too much of them. They serve admirably for the breeding-ground of countless herds of cattle, and the famous Sarde horses, which have much of the Arab in them. If malaria be rampant anywhere, it will be here; for the occasional *stagioni* which break the monotony of the level meads or cornfields near the coast are notorious plague-spots. They have also one other characteristic: they are studded with the objects which have given Sardinia its individuality with antiquaries for all time. Whether we are in the olive or oak woods which vary the grassy flats, or groaning up to a new watershed between one flat and another, we repeatedly pass a building like a martello tower, or a windmill shorn of its top. The buildings are all dilapidated, and their lichened stones are overgrown with ivy and a thicket of scrub. For the most part they stand remote from villages or inhabited houses. Often they cap rocky knolls, or rise like a lighthouse on the edge of a bluff. Or they are set simply in the plain, with modern cincture of meadow-land or grain-fields. These are the renowned *nuraghe*, or round towers, of Sardinia, about which volumes have been written. Their number is said to exceed three thousand. Their authors and their original purpose are alike conjectural. Some say they were built by the first natives of the soil as dwelling-

places, or towers of refuge. Others trace them to the Carthaginians, and regard them as altars upon which living children were sacrificed to Moloch and other gods of the Phœnicians. The peasants of our day shrug their shoulders if they are interrogated about them. 'How should we know what they are?' they ask. 'They were built before the Deluge by another kind of men.' Among the various other uses ascribed to the *nuraghe* there is space to mention only the following: they are tombs of the heroes of Sardinia or of the first inhabitants, temples, granaries, shrines, treasure-houses, &c. But whatever they were—and of the various theories about them, that which ascribes them to the earliest inhabitants for towers of refuge is intrinsically the most satisfactory—they give a unique interest to this island.

We have already mentioned the Barbagia province of Sardinia. Here the mountains rise concentrically to Gennargentu (6266 feet), the highest peak in the land, confessedly rather tame in its broad swelling hump shape. But the dolomitic rocks (*tacchi*, as they are called) of Perdaliana, near Gennargentu, are extremely picturesque. These isolated crags are wooded to their crests, and the haunt of the mouflon and the eagle, which are well protected by their precipices. Elsewhere in Sardinia are other *tacchi*, culminating in similar castellated piles, and as difficult of access. But more engaging even than the *tacchi* are the glorious woods of oaks and cork trees which still clothe much of the mountain slopes. There has been a terrible amount of denudation by fires, reckless felling, and mutilation. The island is not now the magnificent timber-yard it was in the days of Bonaparte, who at one time was as eager to secure it for the sake of its ship-material as was Nelson for the sake of its harbours. Nevertheless, the relics of its forests are still very charming.

Among the mountain villages the traveller is a distinct curiosity, and he must look to be treated as such. Little of sweet tranquillity will he be allowed to enjoy in the evening after a hard day's work. While the tedious hours drag on and seem to bring him no nearer to the supper he sighs for, he must hold continuous levee; meet the formal smiles and salutations of the village notables, as one by one they come to pay their respects to him, with smiles and salutations in kind; be ready to answer offhand questions the most inquisitorial; and disposed to make light of the grime, the tobacco-smoke, and the free expectoration about the boards of the room in which he is to pass the night. From the most civil motives, the worthy folks will try to intoxicate him ere bedtime, and he will be lucky if he defeat their intentions. As a rule, indeed, the Sardinian wine is excellent; but in the mountains it is not so.

As a health-resort, indeed, Sardinia cannot, upon the whole, be praised during the summer months. As years go by, doubtless it will become less malarious; but vast areas of marsh will have to be drained and forests of eucalypti planted ere it can be pronounced safe. Not here, as in the United States, does one see unpleasant advertisements of coffins and ague-cures upon the tree trunks, to warn the wayfarer of his fate; but there is a something in the air, especially at sunrise and sundown, which no less effectually

arouses his suspicions. This sensation in certain places eventuates in a headache, which of course may develop into worse things. The Romans, with their wonted acuteness, knew how to utilise the bad air of Sardinia. The island was their haven for troublesome criminals and prisoners. Tacitus mentions a body of four thousand superfluous Jews and Egyptians who were settled here, and he observes that it would be thought no great matter if they perished in the ungenial climate.

It is almost impossible to assign specific reasons for the malaria in districts so diverse. If in the plains it may be due to the miasma from the soil, such an explanation will not do for mountainous regions, where the hardest kind of rock is a substitute for soil. A workman in an antimony mine said to us that he thought the water was to blame more than the air. The miners drink recklessly from stagnant pools or discoloured brooks. All over Sardinia, the villagers are equally careless. And as the peculiar conformation of the country forces its rivers to drain through a variety of soils, and the sewage of the various villages at different elevations flows freely into the streams, it must be admitted that the water cannot be very wholesome. The wiser Sardes therefore drink wine at all times, guard against chills by wearing sheepskins, and eat neither fruit, fish, flesh, nor fowl from malarious parts of the land.

This, then, is a precaution to be taken by the traveller in Sardinia; and, with ordinary prudence in other respects, it will suffice to carry him unharmed through the island. The many curious and pleasant memories with which a country still vacillating between barbarism and civilisation will assuredly afford him, will then be unadulterated.

A TERROR TO EVIL-DOERS.

CHAPTER II.—CONCLUSION.

THE inquest was duly held. Captain Frere examined the witnesses—the shepherds who had found the dead bodies lying near the extinguished fire, and Dr Sewell, who certified that the men had died from wounds caused by a pistol bullet; and everybody looked upon the affair as over. It was a regrettable accident, a thing for which somebody ought to be hanged, if one only knew who that somebody was; but it was over, and the excitement it had caused died away. Within even twenty-four hours of the discovery of the dead men, most people had found something else to talk about.

To many people, Captain Frere's engagement offered a more inviting topic—to Miss Jenny Birch, for example. Whether gentleness of temperament be the cause or not, most women, dearly as they love sensation, would rather hear of a single marriage than of half-a-dozen deaths; and though Miss Birch felt annoyed, and in a sense ill-used, that Madge Renton, who was five years her junior, and was, besides—she considered—absolutely plain, was to be married, she could not keep the objectionable topic from her mind and tongue. She questioned her father minutely

about the manner in which 'the doctor' had announced and 'the captain' received the news; and made him repeat the story so often that at last he exclaimed irritably that he wished he had never said a word about it. There was no question of keeping the engagement a secret now; Miss Jenny made that quite impossible by telling every one who entered the inn to talk about the murder. The effect of this on minds which were fundamentally sanguinary was to confuse therein the clear and lucid—howbeit imaginary—picture of the murder they had held, by superimposing the love-story upon it; a process which resulted in one of those incongruous unions of people and events which mark our dreams, and find a physical exemplification at times in those scrap-work screens, the result of domestic genius, where Her Majesty in full court costume is represented against a background of kitchen dresser, rich in willow-pattern plates.

'If you go mixing up the marriage and the murder in that fashion, lass,' said old Birch to his daughter, 'people'll go away thinking that the captain murdered the policemen in order to marry Miss Renton.'

'Well, father, you are a donkey!' exclaimed Miss Jenny with great candour. 'Who on earth would think that!'

'Why, any one would, from the way you're chattering. Is there a single person who has been in the house to-day whom you have not told?'

Miss Jenny laughed. 'O yes; there is—you didn't expect that, now! I haven't told the sick lady up-stairs.'

'It's because you haven't had a chance, then.'

'Well, maybe. The doctor said I wasn't to go up, for fear of exciting her, and gave old Margaret orders to look after her. Perhaps he thought like would draw to like,' said Miss Birch with some irritation; for she resented being excluded from the stranger's room, and tried to soothe herself by pretending that Dr Sewell wished to spare her the indignity of waiting on one who was very probably a fitter companion for old Margaret—the maid-of-all-work of the establishment and an ex-convict.

Miss Jenny did not mind escaping the task of waiting on the invalid; but she felt wronged at not having the opportunity of retailing her news. It almost spoiled her sleep that night, to feel that she had thus failed in her duty.

With the morning, however, opportunity came. Miss Birch was lounging at her favourite post at the front door, when the strange lady came down-stairs, dressed for walking. She walked slowly, with one hand pressed to her side, as if she feared that any exertion would cause her pain; and the lines round her mouth and between her eyebrows told of suffering already endured and the expectation of more. She had once had a delicate prettiness of flaxen hair and blue eyes, the sort of beauty which seldom outlasts youth, and which in her, disease, and probably enough hardships of another kind, had destroyed sooner than usual. Her clothes were poor and worn, and she seemed conscious of their meanness; yet she had that air of refinement which no woman ever wholly loses who has once possessed it, and which made even Jenny Birch, who preferred to judge people and things by their surface aspect, treat her with respect.

'Are you going out, ma'an?' she asked in surprise, seeing the stranger's feeble steps.

'I am going away,' was the answer. 'Will you ask the groom to get me a carriage to take me to the next station?'

'A carriage?' thought Miss Jenny. 'You don't look one that can afford that; I'd have said from your appearance that the stage-fare was as much as you could manage.' Not being, however, destitute of good-feeling of a pachydermatous kind, she said: 'Haden't you better wait till to-morrow? The stagecoach passes then, and you'd be the better of another day's rest. The doctor won't be pleased at your running away like this.'

The invalid shook her head. 'I want to get back to Melbourne as soon as I can,' she said; 'so I am going to evade the doctor, for fear he should forbid me.—Will you, however, give him my most grateful thanks for his kindness, and ask him to accept this?' She handed the girl a sealed envelope, and proceeded to ask for her bill.

'It's father who manages that part of the business,' said Miss Jenny; and she disappeared for a moment to bid him prepare the account and order the carriage.

'You liked the doctor, didn't you?' she asked when she returned to the guest, who had now seated herself on the bench Captain Frere had occupied the previous day, and seemed to be gratefully inhaling the fresh autumn air.

'I did indeed; he was so kind to me, a stranger, and apparently a poor one. He is in every respect a gentleman.'

'Isn't he, now?' exclaimed Miss Jenny. 'More so than Captain Frere, to my mind; though, of course, the captain's very well connected. But he's not up to Dr Sewell. And if, as they say, Miss Renton could have had either of them—I don't believe it myself—I can't understand how she accepted the captain.'

'What do you mean? What are you saying?' The lady had started from her seat and caught Jenny's hand. Her body was swaying with weakness, but her voice was firm and imperious. 'Tell me what you mean?' she cried again.

'Why! that Miss Renton, the parson's daughter, is going to marry Captain Frere.—There's nothing so wonderful in that, is there?'

But apparently there was, for the lady's grasp relaxed, and if Miss Jenny had not caught her in her strong round arms, she would have fallen to the ground.

Jenny carried her back to her room and laid her on the bed she had lately quitted, then calling old Margaret to attend to her, she ran herself for the doctor.

'It's all my fault!' she said penitently, when she had explained what had occurred. 'Though I don't see yet why Miss Renton's marriage should upset her so. But it seems to be upsetting everybody,' she added with a glance at Philip, who had winced a little when she spoke of Madge; for even in her distress at the strange lady's danger, Miss Jenny was woman enough to feel annoyed—'riled,' as she phrased it—at Miss Renton having won the hearts of both the most desirable men in Picton.

Philip hurried to his patient, and having forbidden her to leave her bed for several days, went off on his rounds, which this time were to include

a journey into the bush that would take two days.

'I'll see you as soon as I come back to-morrow evening,' he promised; 'meanwhile, you must not be guilty of any more such rashness as this morning's work.'

She smiled, but did not answer, perhaps because she was too weak. But when he was going, she caught his hand and detained him a moment. 'You have been very kind to me,' she said. 'Women like kindness; not girls, perhaps—they have never felt trouble, and like a man whose manner masters them. But as life goes on and sorrows come, one learns to appreciate a man who is strong and tender too. You are both, and I wish you all happiness. This morning, when I meant to go away, I left some money for you; but money isn't happiness, is it? If I could only do something to secure that!'

'My dear lady!' exclaimed Philip, bewildered and embarrassed at her words, and so taking refuge in professionalism, 'give me the happiness of seeing you much stronger when I come back, and I'll ask nothing better. I suppose success in our vocation is the best happiness we can look for in this life.'

The touch of bitterness in his words did not escape her; but she said nothing, and he went away.

'As soon as he is gone, I shall get up and do the work that has fallen upon me, and then go away.' This was her thought; but she was tired and languid, and unconsciously let the minutes slip away into hours without doing anything. Miss Jenny, remorseful and tender, brought her first soup and afterwards tea; and as she took each she said to herself, 'I must get up as soon as I have finished this;' and yet lay down again as she put aside the empty cup. At length the rays of the sun streamed, yellow as bright amber, into her room, and she knew that it was wanting afternoon. Then, with a great effort she rose and put on her shabby garments—very slowly, because it fatigued her so; and when she was dressed, looked and listened from the top of the stair, to be sure that no one was about, to intercept her escape. As it chanced, Miss Jenny was out, gone to talk over recent events with a friend; old Margaret was in the kitchen; and Birch himself was sleeping the afternoon sleep of the well-fed and portly within the bar; so she was able to leave the house unseen.

Once outside, she hurried—or thought she hurried, struggling along at a snail's pace—to Captain Frere's house. He was not at home, she was told in answer to her inquiry; he was at the vicarage; so she went on there.

There was no longer any secrecy about Lewis Frere's engagement; Philip Sewell had put an end to that. 'And, my dear,' said Mr Renton to his daughter, 'I don't see why it need ever have been concealed. Captain Frere should not have suggested keeping me in ignorance, and I can't think why you consented. Why did you, Madge?'

'Oh!—I don't know.' And indeed Madge did not know why she had been glad to say nothing to any friend of her proposed marriage; and still less could she have explained why, now that it was declared, she felt a little annoyed—with Philip, of course. 'He is so much older than I,' she suggested at last.

'That is true; but it is not a fatal barrier, other things being favourable. His position is satisfactory. I think he deserves the scriptural definition of a ruler, "A terror to evil-doers, and a praise and protection to them that do well." And if you love him, Madge, there's nothing more to be said.'

'I suppose not,' she answered dubiously.

Being thus, to public knowledge, an engaged man, Captain Frere was minded to enjoy the privileges of his position by spending as much time as he could with his betrothed. It is true that her society did not seem to give him much pleasure. He was gloomy; and she, being out of humour herself, though she tried to feel and act as the maiden should whom a good man has chosen as his wife, ventured to complain of his taciturnity. He said that he was thinking of 'those two poor fellows,' which was a very pretty reason, but hardly accounted for his being nervous and irritable as well as grave; still less did it account for his impatient exclamation when she touched on that very subject. 'For heaven's sake, Madge, don't talk of that affair. Every one has been chattering about it till I am sick of hearing of it.'

Madge was bewildered and hurt; but, still striving to do her duty, like the hero of the thirty years' courtship described by Lewis Carroll, 'as she had read in books,' she began a coquettish teasing about her lover's beard. It was quite common in novels for the heroine to find fault with the way her lover parted his hair or with the fashion of his collars and neck-ties; and to ask him to sacrifice moustache or whiskers for her sake was equivalent to the hardest 'quests' of the old chivalrous days. And surely Frere's beard was a safe subject!

But it was not. He nearly lost his temper when she suggested that he should shave it off.

'To please you! Why should I make a fright of myself to please you? You would regret it after I had done it. Besides, I am subject to colds; my throat has been weak ever since that beastly winter in the trenches, and the beard is my best protection.'

'Why did you not tell me that at once?' she asked gently. 'Of course, I would not have you do anything that would hurt you; but I did not know that was why you wore a beard. It was stupid of me, though; I might have noticed that even this mild evening you have your throat wrapped up. You caught cold that night you were out, I suppose?'

'Yes. And that's another thing I want to warn you about. Don't blazon my comings and goings as you have been doing; half my usefulness would be gone if people could calculate where I had been and where I was likely to go. I didn't want people to know I had been out two nights ago, and when Sewell spoke of it I denied having gone. Don't look so con—fearfully shocked; it was my duty, you know. And then he came down on me with your authority. Don't go chattering in that way again; remember that.'

'I'll remember,' said Madge meekly; but she could not help feeling that being 'engaged' was not half so pleasant as her girlish fancy had dreamed. And if this was betrothal what would marriage be like? Husbands are proverbially not more considerate than lovers. She felt depressed,

and sat silent for a moment; and on this silence brot the announcement that a lady wanted to see Captain Frere.

'A lady! What lady? I can't see her!' he exclaimed abruptly in a harsh voice. Madge noticed that his face grew pale, and thought it was with anger at this visitant—doubtless some one with a legal grievance, and as impatient and importunate as claimants mostly are.

'I don't know who she is,' answered the maid who had brought the message, in the tone of independence which the British domestic assumes in the freedom of colonial air; 'but she says she must see you, and won't be put off. She's waiting at the front door.'

'Yes, I must see you,' said a voice behind; and the strange lady from the inn, who had not waited at the door, slipped past the astonished maid into the room. 'I wanted to see you alone, Lewis, and to beg you, for honour's sake—not for mine; I expect no grace from you—not to be guilty of the wrong people say you meditate. I would have spared your good name if I could; but I have no time to spare, and perhaps it is just as well that this lady should know the truth. She must never marry you, Lewis, not though I lay dead at your feet, for you are not a man who deserves a good woman's love.'

So far, Captain Frere had let her go on because he could not find voice to interrupt her; he had striven to speak, but the words would not come. Now, however, he exclaimed: 'Be quiet; go away, and I'll see you elsewhere.'

'I will not go; I must speak now.'

He lifted his hand, as if to push her away; but Madge came between them.

'Captain Frere,' she cried, 'you shall not behave so in this house. Why are you afraid of this lady?—for I can see you are afraid of her. What is it you have to say to him, madam? Is it anything I may hear?'

'It is something you must hear, Miss Renton—you are Miss Renton, I suppose?—if your happiness is to be saved. It is, that I am this man's wife.'

'It's a lie!' protested the captain.

'No lie! It is the truth. I have the certificate here; thank heaven, I was not weak enough to give it up to you when you asked. But I would have kept the promise I made you two days ago, when you gave me the money to take me back to Melbourne, never to trouble you again, if I had not heard that you meant to marry this young lady. I could not be a party to that.—Here is your money, since I have not kept my word.'

She had spoken feebly, with frequent pauses for breath; but Frere had seemed unable to check her words. He read belief in Madge's face, and knew that nothing he could say would win her trust again. But when his wife held out a roll of bank-notes to him, he struck it angrily from her hands. It was not a violent blow, though it came from a reckless and revengeful soul; but it seemed to have more power than mere physical force could account for, for as she received it, Mrs Frere fell to the ground. Madge threw herself beside her and raised her up, only to see the sad eyes grow dull with the film of death.

'You have killed her!' she exclaimed to the man who an hour ago had been her lover. Only an hour?—only a few minutes! It seemed a cen-

tury, or more—a memory of something that had occurred in a past life, fresh only in its power to shame her.

'She was dying; she would have died anyhow—why could she not have kept silence!' he answered with a cold cynicism that sickened her. Then he came and touched her shoulder as she bent over the dead woman. 'Madge,' he said, 'I swear to you that I loved you honestly and truly. I thought to get rid of this—barrier; and if you had never known, it would not have mattered to you.'

She did not answer him; but she withdrew from his touch with a glance of loathing, and rising to her feet, she crossed the room and rang the bell. He saw that all was over for him, and as he heard the foot-steps of the maid outside—who, having listened at the door to the scene that had passed, was now slipping away a short distance, in order to return, as from the kitchen, in an ostentatious fashion—he rushed from the room. First, however, he picked up the bundle of notes that lay, half unrolled on the floor, and thrust them in his pocket.

If possible, a deeper scorn came over Madge's face. 'He has time and thought for meanness in the midst of his discovered guilt,' she said to herself.

Certainly Pictou was unwontedly rich in sensations just now. The strange lady's death was the climax of all; for though all the circumstances of it were not understood, enough had been grasped by the eavesdropping domestic to show that there was a certain connection between the dead woman and Captain Frere, and every one knew that it had terminated the recently announced engagement between him and Miss Renton.

Miss Birch was full of the theme, with the latest variations, when Philip Sewell came home. He had gathered from the old woman who was supposed to look after his comfort, only that his patient at the inn was dead; for his servant was deaf, and being unamiable as well, had often to go stinted in the matter of news because no one would take the trouble to shout details of local event into her ear. Philip therefore heard the tale from Miss Jenny, who, having an imagination that was shrewd as well as active, and more knowledge of the facts than any one in the town besides Captain Frere and Madge, gave him a not unfair idea of the state of matters.

'There was some connection between that lady and the captain,' said Miss Jenny in conclusion; 'and whatever it was, it has broken off his engagement to Miss Renton—that seems to be certain.'

Philip was silent, filled with many emotions, thankful that Madge was not to marry a man whose past evidently held something he wished hidden, yet uncertain if his thankfulness was not vindictive spite.

'She left a letter for you, doctor, when she meant to go away that morning, before she fainted. I forgot to give it you; here it is.'

Philip took the envelope, and on opening it, found some unsigned words of thanks and a bank-note.

'I don't want her money, poor creature!' he exclaimed. 'If she has prevented Miss Renton' — He stopped, afraid of betraying too much, and added: 'And my fee wouldn't have come near five pounds.'

'Well, doctor, she meant it for you, so you'd best take it, I should say.'

The doctor looked dubious, and stood crumpling the note between his hands. 'Did she pay your father's bill?' he asked finally.

'No; she went out, you know, and died at the vicarage; and it seems there was no money found on her; at least there's been no word of any. And I don't suppose father would get much, if he asked Captain Frere to pay. Besides, under the circumstances, poor thing'—

'Look here, Miss Jenny'—Philip jumped at the idea that had come to him—'you take this towards paying what she owed you. It isn't right that your father should lose by this poor lady; my services were very useless, and besides, they're not solid facts, like the comforts of an inn.'

Jenny protested; but Philip was firm; and old Birch, when appealed to, took a practical view of the matter. 'There was her bed and her food, and brandy when she fainted; and there were things that were bought and had to be paid for; and there was no reason why he should be out of pocket,' he said.

So the five-pound note passed into Mr Birch's keeping; and as this was the time when he usually took a journey down the country to buy in goods for the winter, he took it with a good many others to his bank at Melbourne. And here a strange thing occurred. Mr Birch was arrested for being in possession of one of the notes stolen from the policemen who had been murdered near Picton. Fortunately, the innkeeper was a careful man, who could give an account of all he possessed; and from the entry in his cash-book it was proved that the note in question had been given him by Dr Philip Sewell, and was the one left to the latter by Mrs Frere. Where had she got it? Proof, though not suspicion, might have been at fault here, if Madge Renton had not come forward and told how Mrs Frere had spoken of money given her by her husband to buy her off; and also how Frere, when leaving the room where his wife's dead body lay, had had forethought enough to pick up the notes that had fallen from her hand. It cost Madge much to do this, conscious that thereby she must renew a strain of gossip that was torture to her; conscious, too, of Frere's reproachful eyes, that seemed to plead Gloucester's extenuation of his crimes to Lady Anne—'Twas for thy sake I did it.' But to Madge the plea was worse than useless; she remembered too well the worn anguished face of the deserted wife who had died in her arms.

Then the law laid its hand on Lewis Frere; and he, seeing that all hope of escape was over, even though he had burned the notes he had reclaimed from his wife, made cynical, bitter confession of his sins. 'There aren't many things worth risking one's life for,' he said, 'and a woman's liking isn't among them.' When the jailers were cutting his hair and beard before putting him in convict dress, they found a scar, not yet wholly healed, beneath his chin. When asked how it came there, he told them that it was caused by a bullet which one of the policemen had fired almost at random. 'I thought myself lucky then that it only grazed me; I wish now that it had shot me dead.'

No one was surprised when, soon after this, it appeared that Miss Renton was to go to England for a year or two to visit her mother's relations.

It was felt to be the best thing she could do—to get away from Picton for a time; and friends hoped that she would marry at home, and so get over this sad affair, as they called it.

Philip Sewell, when he heard the news, debated with himself during a sleepless night, and then went up to the vicarage. 'Madge,' he said, 'I am going to repeat a statement that angered you once, and may do so again. I am sure you never loved Frere; but I know that doesn't prove that you love me—I wish it did.'

He paused; but Madge made no reply beyond a blush.

'I had a letter last mail,' he went on, 'from an old friend, who offers me a chance—a good chance—of practice in England. But I like Picton well enough, and I am getting on, so I won't accept, unless—unless, dear, you will make it worth my while to leave Australia by coming with me.'

Still she said nothing; but she looked up with an expression in her eyes which Philip thought justified him in clasping her in his arms; and probably he was right.

UNCOMMON ACCIDENTS.

A SINGULAR action was tried in the Greenwich County Court in March 1888, wherein a widow sued a baker for damages, medical attendance, and loss of time, from the sticking of a pin in her throat. It appeared that the woman purchased a Bath bun at the defendant's shop and went out eating it. When she had got half-way through it, she felt something stick in her throat, and at once went to a house close by and asked for a drink of water; shortly after which the pain became so intense that she went to a doctor, who, after trying various measures for nearly an hour, succeeded in extracting the pin. The baker's counsel submitted that there was no case of negligence; but the judge, after remarking that it was of course an unfortunate accident for both parties, gave a verdict for the plaintiff for the amount claimed and costs.

Though this particular accident fortunately did not prove fatal, others of an equally trivial nature have suddenly severed the thread on which the life of man hangs. At Macclesfield, in February 1889, Isabella O'Grady, wife of Frank O'Grady, died of a punctured wound received in the chest. While playing in *Friction*, she commenced some knitting while waiting her turn to go on. An actor passed her as she sat in the wings, and in order to allow him to do so, she stooped forward, when the knitting-needle entered her chest. She finished her part; and medical aid was then called, but the case was hopeless from the first.

In August 1768, a harvest labourer went into the *Cock and Bell* at Romford, Essex, to refresh himself after his day's work. He called for a pint of ale; but before he had finished it, his throat began to swell, and in about two hours the poor fellow expired in agony. Upon opening his windpipe, it was found that he had swallowed a wasp, which had stung him, causing his death.

A very similar thing happened in 1760 to a

horse, belonging to a farmer named William Cross, that had been turned out to grass. In the morning he was in perfect health; but at about five in the evening he was observed to give over feeding; and on examination his neck was found to be considerably swollen. It continued to swell until the fourth day, when he died. The owner, anxious to know the reason of the animal's death, caused his neck to be cut open, when, to the great surprise of several spectators, a large adder was found in the throat, and the parts all round mortified.

About midnight on August 15, 1792, two fishermen belonging to Hull were employed near the Spurn. One of them, named Samuel Sallics, having both his hands occupied in drawing the net, caught the head of a sole, which was endeavouring to escape through a hole in the net, between his teeth—a very common practice among fishermen. The fish, making an effort, sprung into the man's throat, who, being thereby rendered incapable of crying out to his companion, went towards him and made him sensible by signs of his melancholy situation. His comrade instantly laid hold of the sole's tail; but not being able to extract the body, the man was suffocated very soon after reaching their boat.

The following should serve as an additional warning to those who are in the habit of balancing themselves on their chair at table. An engraver named Wilkins died at Somers Town on the 28th of May 1814, in consequence of having fractured his skull. He was drinking tea, and, according to his usual practice, balancing himself upon the hinder feet of his chair, when, losing his equilibrium, he fell backward, striking his head upon a marble slab. He was picked up insensible, and died within four days.

Another tea-table accident of an extraordinary nature befell Dr Hoare, Principal of Jesus College, Oxford, and Prebendary of Westminster. As the family were seated at their evening meal, one of them moved the table upon his favourite cat, causing the animal such pain that it flew directly at the doctor, wounding him with its claws. The wounds thus caused brought about the doctor's death.

In May 1769, Mr Amcott, a schoolmaster in Seven Dials, in cutting a quill pen dropped his penknife. He closed his legs to try and catch it, when the penknife pierced his thigh so deeply that it killed him.

In all the cases thus far narrated the cause of death was of the most trifling nature, reminding us forcibly how 'in the midst of life we are in death.' Those that follow, though endorsing the same truth, are remarkable rather for their peculiarity.

On the 17th October 1814, the neighbourhood of St Giles, London, was thrown into consternation by one of the most extraordinary accidents ever recorded. About six o'clock in the evening, one of the rats in the extensive premises of Messrs Henry Meux and Company, in Bunbury Street, burst; and in a moment New Street, George Street, and several others in the vicinity, were deluged with the contents, amounting to three thousand five hundred barrels of strong beer. The fluid in its course swept everything before it.

Two houses adjoining the brewery were totally demolished. The neighbouring inhabitants, all of the poorer classes, were nearly all at home. In the first-floor of one house, a mother and daughter were at tea; the mother was killed on the spot, and the daughter swept away by the current. The back-parts of the houses of Mr Goodwin, poulterer, of the *Tavistock Arms*, and of Nos. 24 and 25 Great Russell Street, were wrecked; and a female servant of the *Tamstock Arms* was drowned. In clearing away the debris, nine bodies were found, and one poor creature was dug out alive. Many cellars were completely inundated; and in some houses the inhabitants only saved themselves from drowning by mounting their highest pieces of furniture.

In November 1815, a melancholy accident happened at Waltham Cross. The Boston coach stopped there for a short time, when the horses suddenly turned into a low covered gateway, where there was no headroom for the passengers on the roof. The consequence was that four of them were so completely jammed between the coach and the roof over the gateway as actually to stop the vehicle. When the sufferers were relieved from their unhappy situation, one of them was quite dead, and the others were so crushed that they survived but a short time.

After detailing such a category of disasters, we may make some amends by relating two instances of a more fortunate experience than the last, due to the like force of habit in animals. In the early part of January 1764, the driver of a stagecoach going to Newbury fell dead from his box within three miles of that place, but was not missed by the passengers till after their arrival, the horses having brought them to their inn without any stop or accident; a remarkable instance of the great sagacity and tractableness of that noble animal.

On the night of October 16, 1813, after the Glasgow mail had changed horses at Polmont, the guard and coachman being both intoxicated, the latter having dropped the reins, in endeavouring to recover them fell from his seat, and the coach going over his head, he was killed on the spot. Meanwhile, the horses being at full gallop, the guard was so perfectly incapacitated that he could make no effort to stop them, and they continued at full speed along Linlithgow Bridge, till they came to the post-office in that town, where they stopped without the slightest injury.

Another curious incident of the old coaching days is the following. One day in February 1807, as the Liverpool mailcoach was changing horses at the inn at Monk's Heath, between Congleton, in Cheshire, and Newcastleton-under-Lyme, the horses which had performed the stage from Congleton having just been taken off and separated, hearing Sir Peter Wamburton's foxhounds in full cry, immediately started after them, with their harness on, and followed the chase until the last. One of them, a blood-mare, kept the track with the whipper-in, and gallantly followed him for about two hours, over every leap he took, until old reynard, who was a cowardly rogue, had led them round in a ring-fence, and ran to ground in a Mr Hibbert's plantation. The sportsmen who witnessed the feat of this gallant mare were, Sir Harry Manners, Messrs Cholmondeley, Layford-Brook, Corbett, Davenport, Townshend, &c.

These spirited animals were led back to the inn at Monk's Heath, and performed their stage back to Congleton the same evening, apparently in high spirits for having had a brush after the fox.

ENGLISH FOLK-RHYMES.

ENGLISH folk-rhymes are very numerous and curious. Characteristics of persons and places have given rise to not a few which are frequently far from complimentary. Weather-lore is often expressed in rhyme, and the rustic muse has rendered historic events popular, and enabled persons to remember them who are not readers of books. The lines often lack polish, but are seldom without point.

Amongst the more ancient rhymes are those respecting grants of land. The following is a good example, and is from Derbyshire :

Me and mine
Give thee and thine
Millners Hay
And Shining Cliff,
While grass is green,
And hollies rough.

The old story of the grant is thus related. Years ago, a member of the ancient family of Lowe had the honour of hunting with the king and his nobles. Lowe rode a splendid horse, and it was the only one in at the death. The king admired the animal very much, and the owner presented it to His Majesty. The horse 'mightily pleased the king.' Some little time afterwards, Lowe waited upon the king to beg a brier-bed and a watering-place, which were Shining Cliff and Millners Hay. The request was at once complied with. The tale does not end here. It is related that 'an envious courtier told the king that he did not know what he was doing, for what he was giving away was a great wood with a large tract of land.' Upon this, Lowe said to His Majesty : 'King or no king?—'Why, king, Lowe.' Adding with promptitude : 'The brier-bed and watering-place are thine : ' the rhyme above quoted being given as the title for the grant.

It is asserted that Athelstan granted the first charter to the ancient borough of Hedon, Yorkshire, in these words :

As free make I thee
As eye see or ear hear.

It is said a similar charter was granted by the same king to the neighbouring town of Beverley.

An old, old Norfolk rhyme says :

Rising was a seaport town,
And Lynn it was a wash;
But now Lynn is a seaport town,
And Rising fares the worst.

It is said at Norwich :

Caistor was a city ere Norwich was none,
And Norwich was built of Caistor stone.

'About half-way between Curbar and Brompton, to the right of the turnpike leading from Barlow to Sheffield,' writes William Wood, 'there is, far on the moor, a very level flat piece of ground, near a mile square, most remarkable for its boggy nature, so much so that it is dangerous to cross, or at times to approach. Here, before the Roman invasion, says the legend, stood a town or village, the inhabitants of which lived, according to

Diodorus Siculus, in small cots or huts built of wood, the walls of stakes or wattles, like hurdles, and covered with rushes or reeds. These dwellings, with their inhabitants, were swallowed up by one of those convulsions of nature so destructive at times to the habitations of mankind.' Respecting Leech Fend and Chesterfield are the following lines current in Derbyshire :

When Chesterfield was heath and broom,
Leech Fend was a market-town;
Now Leech Fend is all heath and broom,
And Chesterfield a market town.

Respecting Nertoun, a Somersetshire village, near Taunton, is this couplet :

Nertoun was a market-town
When Taunton was a fuzzy down.

A Scottish rhyme says :

York was, London is,
And Edinburgh will be
The biggest of the three.

Says a popular English rhyme :

Lincoln was, London is,
And York shall be
The fairest city of the three.

In the days of old it was the practice to allow the wives of the Lord Mayors of York to retain by courtesy the title Lady for life, and this custom gave rise to the following couplet :

The Lord Mayor's a lord but a year and a day;
But his Lady's a lady for ever and aye.

Few English towns have made greater progress than the thriving port of Hull. Its prosperity was predicted long ago :

When Myton is pulled down,
Hull shall become a great town.

As a matter of history, it may be stated that when the town was threatened by Charles I., a number of houses in Myton Lane, as well as the Charter-house, were laid in ruins by Sir John Hotham, governor of Hull, so that they might not give shelter to the Royalists. Ray refers to this couplet, and, in error, calls Myton, Dighton.

Selling church-bells has given rise to satirical rhymes. Here are three Lincolnshire rhymes on this topic :

The poor Hatton people
Sold the bells to build up the steeple.

The next says :

Owersby's parish,
Wicked people,
Sold their bells to Kelsey
To build a steeple.

It is stated in the third :

Poor Scartho people,
Sold their bells to repair the steeple.

About 1710, the spire of Arlesey Church, Bedfordshire, fell down, and it is believed the bells were broken. The metal was sold to a distant parish to raise money to rebuild the spire, and until the year 1877 only one small bell was suspended in the steeple to call the inhabitants to the house of prayer. The transaction gave rise to the saying :

Arlesey, Arlesey, wicked people,
Sold their bells to build their steeple.

About half a century later, a similar accident occurred at Welstead, and the bishop granted a license to sell three of the bells, to enable the parishioners with the proceeds to restore the tower. It gave rise to a taunting distich similar to the one at Arlesley.

On the walls of the Newington Church, London, in 1793, was written a rhyme anent the rebuilding of the church without a steeple and selling the bells :

Pious parson, pious people,
Sold the bells to build the steeple ;
A very fine trick of the Newington people,
To sell the bells to build a steeple.

Rhymes on steeples are very common ; perhaps the best known is the one on Preston, Lancashire :

Proud Preston, poor people,
High church and low steeple.

In a somewhat similar strain is the one on Bowness-on-Windermere :

New church and old steeple,
Poor town and proud people.

Lincolnshire rhymes are very numerous, and a complete collection would almost fill a book. Here are three :

Gainsbro' proud people
Built a new church to an old steeple.

According to the next :

Luddington poor people
Built a brick church to a stone steeple.

A question is put and answered thus :

Boston ! Boston !
What hast thou to boast on ?
High steeple, proud people,
And souls that souls are lost on.

The village of Ugley, Essex, supplies a satirical couplet :

Ugley church, Ugley steeple,
Ugley parson, Ugley people.

An old triplet describes the characteristics of three church spires thus :

Bloxham for length,
Adderbury for strength,
King-Sutton for beauty.

Almost every district furnishes examples of bell rhymes. We give one example, and it is from Derbyshire :

Crich two roller-boulders,
Wingfield ting-tangs,
Alfreton kettles,
And Pentrich pans,
Kirk-Hallam candlesticks,
Cossall cow-bells,
Denby cracked puncheons,
And Horsley merry bells.

It is very generally believed in Derbyshire that the town of Alfreton was once the stake at a game of cards—'put,' and that the loser exclaimed on the cards being dealt out :

If I have not an ace, a deuce, and tray,
Farewell, Alfreton, for ever and aye.

There is a similar couplet respecting Carnfield Hall, near to Alfreton. It is related by Mr E. Kirk, a Lancashire folklorist, that the owner of a large farm in Goosnargh, called Landscales, staked

his land at a game of 'put.' He received his three cards, which were a tray, a deuce, and an ace, and he put—that is, struck the table with his fist, in proof of his resolution to abide by the issue of his cards. His opponent had two trays and a deuce. The farm was consequently lost, and its owner exclaimed :

Ace, deuce, and tray,
Landscales, go thy way.

A Derbyshire rhyme refers to the inhabitants of four places as follows :

Ripley ruffians,
Butterly blocks,
Swaunwick bulldogs,
Alfreton shacks.

Equally severe is the following on the people of the villages between Norwich and Yarmouth :

Halvergate hares, Reedham rats,
Southwood swine, and Cantley cats,
Acle asses, Moulton mules,
Blighton bears, and Freethorpe fools.

Of Derbyshire folks it is said :

Derbyshire born and Derbyshire bred,
Strong in the arm, but weak in the head.

We next give two Kentish rhymes :

Sutton for mutton,
Kerby for beef,
South Dargo for gingerbread,
Dartford for a thief.

This is complimentary :

English lord, German count, and French marquis,
A yeoman of Kent is worth all three.

It is said of Herefordshire :

They who buy a house in Herefordshire
Pay three years' purchase for the air.

Says a Gloucestershire rhyme :

That is the eye
Betwixt Severn and Wye.

In the same shire is the next couplet :

Beggarly Birley, strutting Stroud,
Hampton poor, and Painswick proud.

Many more rhymes similar to the foregoing might be given, if space permitted ; but we have only room for a few more examples, and they will relate to the weather. An old distich says :

When clouds are on the hills,
They'll come down by the mills.

Another rhyme states :

When the mist comes from the hill,
Then good weather it doth spill.
When the mist comes from the sea,
Then good weather it will be.

In Worcestershire there is a saying :

When Bredon Hill puts on his hat,
Ye men of the vale, beware of that.

Says a Yorkshire rhyme :

When Oliver's Mount puts on his hat,
Scarbro' town must pay for that.

In the same broad shire is a similar couplet :

Wether Ingleboro' wears a hat,
Ribblesdale'll hear o' that.

When clouds are observed on Masson, at Matlock, Derbyshire, the people say :

Masson top has got a cap,
And Darley Dale must pay for that.

It is said of Dunkrey, Somersetshire :

When Dunkrey's top cannot be seen,
Horner will have a flooded stream.

DEODAND.

'**VERDICT**—Accidental death. Deodand 20s., and the gun forfeited.' Thus ran the verdict of the coroner's jury on July 14, 1818, just seventy years ago, on the body of a gardener, named Saunders, who had come by his death through the accidental discharge of a spring-gun at Tottenham; a common enough verdict even such a short time back; and yet how few people now living know the word deodand, much less could explain its meaning. The law of deodand, which was an English one, and unknown in Scotland, was abolished by Act of Parliament in 1846. The practices relating to it were sufficiently curious to justify narration.

The derivation of the word is obvious, from the Latin *Deo dandus*, 'given to God,' and was used to denote the particular thing or unreasonable creature which was the immediate cause of a person's death, which had to be forfeited to the king, as God's executor, and sold, the proceeds being applied to pious and charitable uses under the direction of the High Almoner. Its original purpose would seem to have been as an expiation for the souls of those snatched away by sudden death, and for the pacifying of God's wrath in the case of any misfortune by which a Christian came to a violent end without the fault of any reasonable creature.

The first portion of the law, which we may term the statical portion, had reference to deaths caused in some manner by a stationary object; as, for example, a fall from a haystack or a tree. No deodand was held to be due on account of an infant not yet arrived at years of discretion, as such a one was presumed to be incapable of actual sin, and consequently not in need of propitiatory masses. But in the case of an adult, the hayrick, tree, or whatever else it might have been, was invariably forfeited, as, according to the belief of the founders of the English law, every adult was considered to die in actual sin. One authority puts it thus: 'The deodand is to be sold, and the price distributed to the poor, for the soul of the king, his ancestors, and all faithful people departed this life.' It mattered not whether the owner were concerned in the killing or not. Even if one man shot another with a stranger's pistol, the pistol was looked upon as an accursed thing; and the grand-jury would find 'that the shot was delivered from Mr 'So-and-so's pistol, value five shillings and sixpence, and that the king, or his grantee, may claim the deodand;' and it was no deodand unless presented by such a jury of twelve.

The second or dynamical portion has reference to a person killed by something that was in motion, as, for instance, being run over in the street, '*Omnia quæ movent ad mortem sunt deodanda*;' and in such a case, be the victim infant or adult, both horse and cart would have

been forfeited, in order to punish the owner in some measure for his negligence. Nor is this the only country in which such penalties have been exacted; for we find, among the various laws laid down by Moses in the twenty-first chapter of Exodus, that 'if an ox gore a man or a woman that they die; then the ox shall be surely stoned, and his flesh shall not be eaten; but the owner of the ox shall be quit.' Among the Athenians, also, anything that crushed a man to death was either exterminated or cast out of the dominions of the republic; and another of our ancient laws, which compelled the filling in of a well in which any one had been drowned, in presence of the coroner, has its counterpart in the twenty-first chapter of Exodus, verses thirty-three and thirty-four, where we read, 'And if a man shall open a pit, or if a man shall dig a pit, and not cover it, and an ox or an ass fall therein; the owner of the pit shall make it good.'

There is one peculiar distinction between, as we have termed them, the statical and dynamical portions of this law, which is this: In the latter, the thing was forfeited in its entirety, whereas in the former sometimes only in part. A couple of simple illustrations will render this more clear. Suppose a man to be run over and killed by a loaded wagon; horse, wagon, and load were all held to bear a share in the responsibility, and were consequently forfeited; but if a child died from falling, say, from the wheel of a standing cart on which it was clambering, that one wheel only was deodand.

The law, moreover, applied only to accidents on land, not to those on the high seas, since these are without the jurisdiction of the common law; but in a case of drowning from a vessel in fresh water, both vessel and cargo were liable to forfeiture.

There only remains one other peculiarity to mention, and this with regard to ownership, which was undoubtedly unjust. Did a person die from the effects of an accident within a year and a day of such accident—whatever had caused it, ox, horse, cart, pistol, &c., was deodand. Even if in the meantime the article had changed hands, the present owner was forced to give it up.

LAST WORDS.

You can write down sweet words in a letter,
And try to send love by the post;
You can tell me how vastly 'tis better
To have played the game Love, though we've lost.

You say you are wretched without me;
Have you ever thought what I endure?
The sickening pain—ah! don't doubt me—
Which not even your presence could cure.

For you know that our passionate yearning
Can never be satisfied here;
In the long lane of Life, there's no turning
That I see, which will bring us more near.

By one act of folly once parted,
We must live out our lives, you and I;
And though we are both broken-hearted,
Let us whisper, good-bye, love, good-bye.

AN ISLE OF FARTHEST THULE.

PAPA STOUR.

If you have ever sailed round the west coast of Shetland, you will know that on the north-western extremity of the Mainland, beyond Sandness and beyond the Ness of Melby, there lies the solitary island of Papa Stour. It is not large, being only about two miles in breadth and three in length; and is separated from the Mainland by a strait a little over a mile in width, called Papa Sound. But though the island lies thus close to the Mainland, it is not always easy of approach; for the tides that flow through the Sound are swift and furious, and frequently in certain states of the weather render passage impossible. The name of the island, to strangers, is peculiar. Papa is not an uncommon place-name either in Shetland or the Orkneys, and is said to have been the Icelandic name for the first missionaries who brought Christianity to those islands. Be this as it may, the word Stour means 'big'; so that Papa Stour (pronounced *Pah'-pa Stoor*) is simply Big Papa, to distinguish it from the island of Papa Little, lying about ten miles farther east. Papa Stour is not often visited by the tourist, as it lies out of the conventional tourist-tracks, and is not conveniently accessible; yet the wonderful rock scenery of its western coast is well worth seeing.

Our first visit was made by way of Olua Firth, Swarbacks Minn, and St Magnus Bay, a distance of about sixteen miles; a second and longer visit by crossing Papa Sound. With a favourable breeze the distance by the former route may be covered in two or three hours; but when it is necessary to beat up against a head-wind it may take seven or eight. Yet in sailing through the blue waters and among the green islands of the western Mainland, there is an infinite variety of interest, so numerous are the sea-fowl that crowd these narrow inland voes, or sweep in long and graceful curves round the flapping sails. Groups of 'teisties' or guillemots are seldom absent, carry-

ing out their quick evolutions on the surface of the water, dipping and diving and re-appearing with tireless activity; and when on the wing, displaying their glossy plumage of white and black, with their little web-feet of the brightest vermillion, which look, at first sight, like two red tail-feathers. Or it may be a family of eider ducks following each other in line about the quiet shallows near the shore; or a gathering of big black cormorants, swimming deep in the water, as is their habit, only the head and neck being visible. Or it may be a seal, lifting its gray head above the wave, watching and following the boat afar-off, after the shyly inquisitive fashion of these creatures; or a string of porpoises tumbling past in their wheel-like movements; or even a 'blower'—the local name for the whale—ranging up the firth in the wake of the herring-shoals, showing you a minute his great back-fin and shoulder, as he empties his lungs of water and re-fills them with air, preparatory to another plunge under the waves in quest of his prey. And then, as you near the headland, and lie out towards St Magnus Bay, you have on one hand the craggy rocks of Vementry, on the other the great red cliffs of Roce—massive walls of iron ruggedness, scarped and battered by a hundred storms; with solitary stacks of rock, round whose granite feet the billows rave ceaselessly, churning themselves into foam; or dark sea-caves, gloomy as the portals of Avernus, and melancholy with the long-resounding of many waters.

Next to the huge perpendicular walls of rock that girdle the Shetland Isles—at Fitful Head rising to nine hundred and twenty-eight feet above the sea—what strikes the stranger most is the entire absence of trees. Where the land slopes up from the edge of the voes or bays, the hillsides are in part covered with the cultivated crofts of the inhabitants, lying like bright bits of patchwork in various shades of green. The pastures between are now brown with the hot July sun, and the black peat-mosses are dotted here and there with natives procuring their winter supply of fuel. But over all is no shadow,

save of the crofter's white hut on the hill-side, or of the crofter himself at work. Nothing growing is to be seen higher than the bere or the burdock. And yet there must have been a great growth of trees or other forms of plant-life in distant ages, for the peat-mosses on the Mainland are deep and abundant, and remains of the mountain-ash and other trees are to be found in them still. Why, then, are there no trees now? Is it that the climate is changed?—or is it due to the unenclosed nature of the country, where, for hundreds of years, geese and sheep, cattle and ponies, have been allowed their own will, eating down everything as it grows? At anyrate, there can be no doubt about the condition of Papa Stour. There is not a single tree or bush upon it, and there probably never has been, for there is not an inch of peat-moss on the whole island. If ever Papa Stour had its native poet—and what place in the North has not?—he must needs have been deprived of much of the permanent stock-in-trade of his silvan brothers. For here there are no 'trees' to be 'fanned by the breeze,' no 'murmuring wood' to rhyme with 'solitude,' no 'leafy shade' for 'whispering lovers made.' The western half of the island is as bare as the palm of one's hand, and has in great portions been skinned of what little turf it has ever had, to help out the want of peat, which can only be obtained by fetching it in boats a distance of eight or ten miles. And not of much value is this turf as fuel, after all; one old woman saying it 'made mair reek dan heat.' On the southern and eastern portions of the island, however, there are bits of fairly good soil, on which were growing excellent crops of bere (a coarse kind of barley), oats, turnips, and potatoes.

The great attraction of the island is its rock scenery. Lying farther out in the Atlantic than the Mainland, Papa Stour acts as a kind of advanced guard, and has to meet the full brunt of the mighty waves, that break on it during storms with the noise of thunder, and with a force to which the artillery of war are but as toys. Besides the creeks and voes which indent the island all round, there are evidences everywhere of the great gaps which the sea is making in the solid volcanic rock of which the island is composed. Its mode of operation is easily understood. The rock first gives way at the foot of the cliff, where it is broken and battered by the huge boulders, tons in weight, which the billows hurl against it. In course of time, a cavity is formed by these monster battering-rams; and the cavity grows and grows until it becomes a huge cave or tunnel, arched over by the superimposed cliff. In storms and high tides, when great volumes of water are driven as by a force-pump into this tunnel, the compressed air of the interior will sometimes burst through the upper rock, blasting it as if with gunpowder, and so giving the waters vent, perhaps a hundred yards inland from the edge of the cliff. Once this opening in the solid land is made—and there are more than one such opening at present on the island—the water, in the winter storms, is driven up through it with terrific force, efer, to a height of sixty or seventy feet. And still the process goes on; year by year the opening is widened; until all the rock between it and the sea is wrenched and torn away, bit by

bit, and a great and deep ravine is left, through which the fierce tides foam and chafe at will.*

This process, assisted no doubt by chemical decomposition and other agencies, works slowly, and must have taken thousands of years to effect the havoc and devastation we now see. Neither is the result always the same. Sometimes the water that is driven into these tunnelled-out caves never succeeds in making an opening for itself upwards, and so the tunnelling process goes on indefinitely, as in the case of the Bottomless Geo, which penetrates the island at North Ness to a depth unknown. In other cases, where a comparatively narrow neck of land is operated upon, the rock has been bored until daylight is reached on the opposite side. This has occurred at what is called the Hole of Bordie, which runs for nearly half a mile right through a ness on the north-west side of the island; also at Brei Holm, on the east side, and elsewhere. In calm weather, a native pilot will row you through these tunnels from end to end. Some, such as the long one of Bordie, are dark and dismal retreats; others, like those at Brei Holm, being short and well lighted, are exceedingly beautiful, especially when the sunshine strikes the rippling water, throwing myriad reflections upwards to the high arched roof of rock, where they flit and flicker among the shadows of the warm pink felstone like so many butterflies of transparent gold.

Outside Housa Voe—a place of pleasant memories—and near to Brei Holm, stands the Maiden Stack, an isolated and apparently unclimbable rock perhaps fifty or sixty feet in height, and with the remains of a house atop of it, in which it is said a maiden was at one time immured by her father. But love has signals of its own; and her lover in Northmaven discovered her prison-house, and carried her off. In these ancient stories, as is right and proper, it is always the poor old father who gets beaten in the end. Here, in this voe, the banks of seaweed, seen through the pale emerald of the clear water, are extremely beautiful, clinging to every rock and skerry, and fringing the base of the Maiden Stack in clusters of tasselled green. But it is to the west side of the island you must go for the wonders of rock scenery. Here, on the westmost point of land, rises up from the top of a huge cliff a singular rocky projection, called from its form the Horn of Papa. Its outline on the left, as you approach, will be seen to resemble a human profile—like the face of one who, with fixed gaze, looks far out at sea. Here also are Snolda Stack, Lyra Skerry, Fougha Skerry (the Rock of Fowls); here are geos wild and picturesque, lofty arches cut by the sea-waves out of the solid stone, great masses of rock lying rent and broken everywhere—the huge artillery held in readiness for the next great battle between the Titan forces of wind and wave and cliff. There has been a storm at sea but yesternight, and the long sullen heave of the Atlantic is like the slow breathing and uplifting of the chest of some giant in repose after conflict. Yet ever as the slow wave reaches the shore, its hidden force is made manifest by the white rage with which

* A ravine of this kind is called in Shetland a *geo* (pron. *g* hard, *gyo*). A *voe*, on the other hand, is a bay, or an arm of the sea similar to the lochs of the west coast of Scotland.

it breaks upon and lashes the obstructing cliff, sending great flakes of white foam, like aerated snow-balls, windward across the isle. And all above and around is the flight of innumerable sea-birds, whose shrill wailing mingles sadly with the hoarse roar of the waters, as if each pair of white-wings bore aloft a mourning spirit—mourning for the dead whom the ocean holds.

This western half of the island is barren as a desert. On the top of the sea-cliffs there are fine stretches of grassy turf, green and smooth as the best kept lawn; but away from the shore, the ground has been so scarified that little turf remains, and the rock is exposed everywhere. Here you may see at all times in summer, bands of women, each with a string of little ponies, carrying home the turf which has been previously cut and piled up in stacks. Panniers, formed of straw network, are slung across the backs of the ponies, and filled with turf; then the large basket of plaited straw, called a 'kishie,' which each woman has on her back, is also filled with turf; upon which the procession—woman and ponies, with the ponies' foals and the inevitable sheep-dog—moves off towards the eastern or southern side of the island, where the houses and crofts are. The younger women when at this work cover their head with a little white or red shawl, and look picturesque; the older women mostly affect large black shawls, which they arrange in such a manner across the brow and under the mouth as to leave only a portion of the face exposed, giving them somewhat the appearance of Moorish women. The men at that season of the year are engaged at the sea-fishing, which is the staple support of the people. Without the fishing, indeed, the island could not maintain its forty families in life.

From an early period Papa Stour must have been inhabited, judging from the numerous traces that exist of brochs, Picts' houses, cairns, and stone circles, with those mysterious lines of short upright stones and boulders that intersect the island almost everywhere. Of the brochs and cairns little is left for the antiquary or the curious; they were too convenient as quarries to remain till now intact. The people are of Scandinavian origin, and they still retain a knowledge of the ancient Norwegian sword-dance referred to by Sir Walter Scott in *The Pirate*.

The houses here are much the same as crofters' houses all over Shetland—with low walls, an arch-shaped roof thatched with straw, and weighted down with heavy stones, to secure it against the hurricanes of winter. The fire is on the floor, a little in front of the end wall farthest from the door, and the smoke finds—or at least is expected to find—its way out at an open chimney in the roof. In some houses there are internal chimneys of wood, which arrangement adds much to the comfort of the occupants. In all, there is the spinning-wheel and the ever-clicking knitting-pins, as also the ancient stone quern for grinding their bere into meal. The meal so prepared is called 'burstin,' small cakes baked of it are 'burstin-broonies,' and, when eaten with cream, it is known as 'burstin-pran'—all which words may exercise the etymologist. Each crofter has, as a rule, one or more cows and ponies, with a number of sheep corresponding to the extent of his holding. Some families are, in their rank,

evidently comfortable and well-to-do; others are as evidently poor.

Upon the whole, however, they are of a cheerful temperament, notwithstanding their numerous privations, and enter heartily into any little jest or merriment. The lover of folklore may even still pick up a few tales about those supernatural creatures the trows—related to the trolls of the Scandinavian mythology—'peerie men with long hats,' and great workers in metal. These trows are no longer believed in, but are still spoken of. For, of an evening, when the inmates are gathered round the glowing peat-fire—the women-folk as usual knitting hard, and listening—you may hear, as we heard from the lips of a fine old Shetlander, some of those old-world tales. It may be of the man who one night, in passing Stack o' Barg, a noted haunt of the trows, heard a great noise inside. When he arrived at his place, and was passing the cowhouse, he said to his folks: 'There's a terrible noise in Stack o' Barg to-night.' Now, it so happened that at that moment a trow-wife, who had left her baby behind her at home, was in the cowhouse stealing milk from the cows, and when she heard what the man said, she sprang up from her stool, and crying out, 'Hivla Tivla!—Fivla has faun i' the finna [fire] and brunt itsel', fled from the place. After the trow-woman was gone, a copper pan was found, which within the memory of the narrator was still shown at Feal, in the island of Fealar, as the vessel the trow-woman left behind her on that occasion; and it was said the people who found the pan never wanted for anything so long as they kept it. You may hear also the merry tale of the trow-man and the trow-wife, Shankum and Jinkum, and how one night the miller mischievously scalded Jinkum with his boiling supper as she lay before the mill-fire warming herself.

The memory of these stories is fast dying out, even in Papa Stour. So also is the existence of a usage which at one time prevailed there, as in other places, among the sea-going folk. This was, never, when at sea, to call a thing on land by its right name. The horse, for instance, was called the 'sniggum'; the cow, the 'dron-ye'; the sheep, the 'bleater'; the cat, the 'four-fitter'; the pig, the 'grunter'; the dog, the 'bonny-biter'; the hen, the 'yappie'; a knife was a 'skyoan'; the fire, the 'finna'; and so on. Sea-birds, however, were called by their ordinary names. Superstitions such as these seem, in our modern way of looking at things, difficult to account for. They had their origin, doubtless, in an age when the phenomena of nature were less understood than now; and the sea, to those far-off islanders, must always have been a thing of mystery and of terror. It was at once their chief support and their greatest danger. There was no science, as now, to explain or predict its movements; they only perceived its sudden transitions from calm to storm, its merciless and unmitigable fury when aroused. And reasons sad enough had they for this mysterious awe of the great deep: for the little churchyard in Papa Stour holds not all its dead. That sea of theirs has many a loved one in its secret keeping, and it keeps its secrets well.

As we left Housa Voe for the last time, the island lay like a dark mass against the glowing gold of the northern sky, where the sun was setting.

in unclouded splendour; and as each familiar stack and sherry was left behind, and the figures that watched us from the shore grew dim and dimmer in the gray distance, it was not without regret that we bade farewell to Papa Stour, to the simple pleasures of its kindly people, and the sterile beauty of their island home.

A DEAD RECKONING.

CHAPTER IX.

GERALD BROOKE bade farewell to his wife, and quitted Beechley Towers about an hour after midnight. There was no moon; but the clouds had dispersed after the rain, and the stars shone brightly. His object was to make his way to Penrhyn Court, the seat of Sir John Starkie, the justice of the peace who had signed the warrant for his arrest. It seemed like walking into the lion's den; but it was probably the wisest thing he could have done under the circumstances. Penrhyn Court was one of the last places in the world where anybody would think of looking for him. Mr Tom Starkie had offered to find a secure hiding-place for him for the time being; and after he had once consented to yield to his wife's entreaties and keep out of the way for the present, while awaiting the course of events, it seemed to him that he could not do better than accept his friend's offer. For one thing, he would be on the spot, should anything turn up necessitating his immediate presence; for another, he would be able to communicate with his wife without risk, through the medium of kind-hearted Tom.

Over the parting of husband and wife we need not linger; but it was with a sad heart that Gerald quitted the threshold of the pleasant home where, but such a little time ago, he had looked forward to spending many happy years.

Skirting coppice and hedgerow, and keeping as much as possible in the black shade of the trees, he sped swiftly on his way. The distance from the Towers to the Court was about three miles as the crow flies; and almost as straight as the crow flies went Gerald, taking hedge and ditch and stone wall on his way, and allowing no obstacle to turn him from his course. Once, as he was on the point of emerging from a coppice of nut-trees, he came upon two keepers, armed with guns, who were crossing a meadow not many yards away, evidently on the lookout for poachers. He shrank back on his footsteps as silent as a shadow, and waited for fully ten minutes before he ventured to proceed. Again, at a point where it was necessary for him to cross the high-road, he had a narrow escape from coming face to face with a mounted constable who was riding leisurely along on his solitary round. He had just time to sink back into the hedge-bottom and lie there as motionless as a log till the danger was past.

Mr Tom Starkie had described the position of his rooms to Gerald, so that the latter had no difficulty in making his way to them. "He was

to be guided by a lighted window the blind of which showed a transverse bar of a darker shade. As soon as he found this window, Gerald gave utterance to a low whistle. The light was at once withdrawn, as a token that his signal had been heard; and two minutes later he found himself safely in his friend's rooms.

So far all had gone well; but only the preliminary step had been taken as yet. Not a soul in Penrhyn Court but Tom himself must know or even suspect the presence there of Gerald Brooke. But Tom had thought of all this when he first urged his friend to come to the Court, and had in his mind's eye a certain safe hiding-place, known to him and his father alone, where Gerald could lie by and await the course of events. The hiding-place in question was known as 'The Priest's Hole,' and was an integral part of the oldest portion of the house. A sliding panel in the library, held in its place by a concealed spring, gave admission to a narrow passage built in the thickness of one of the outer walls, down from which access was obtained, by means of a steep flight of steps, to two small chambers hollowed out of the very foundations of the house. These rooms were shut out from all daylight, the walls were unplastered, and the floors of hard dry earth. In the larger of the two was a small fireplace, but without any grate in it, the chimney of which opened into one of the main stacks of the Court. In one corner was a tressel bedstead of black worm-eaten oak, which would seem to indicate that the place had not been without an occasional occupant in days gone by.

The first two hours after Gerald's arrival were spent by Tom in victualling and furnishing this place of refuge. Having encased his feet in a pair of list slippers, his first visit was to the larder, where he requisitioned bread, cheese, butter, tea, coffee, sardines, and sundry other comestibles, greatly to the perplexity of the worthy cook when she came to look over her stores next morning. His next raid had for its objects candles, matches, and crockery. Then came a folding-chair and a spirit-lamp from his own rooms; and so on till he possessed himself of as many articles as he required. Tom took immense delight in these stealthy raids during the small hours of the morning; and more than once he was compelled to come to a stand with his arms full of things and indulge in a silent laugh, which shook him from head to foot, when he thought of worthy Sir John asleep, and of what his feelings would have been could he have seen how his first-born was just then occupied.

The June sun was high above the horizon before Tom's preparations were completed. It was time for Gerald to vanish like a ghost at cockcrow. The two friends shook hands and parted for a little while; but when Gerald heard the click of the sliding panel as it was pushed back into its place, and when he had shut the door at the bottom of the stairs and had glanced once again round the dismal dungeon that was to be his home for he knew not how long a time to come, he felt as if he were buried alive and should never see daylight again. His heart sank lower, if that were possible, than it had sunk before, and for a few moments he felt as if his fortitude must give way. But this mood was not of long duration; he buoyed himself up with the

thought that another day was already here, and that in a few hours more his innocence would doubtless be proved. Presently he lay down on his pallet, utterly worn out in body and mind, and five minutes later was fast asleep.

Of Gerald Brooke's life during the next few weeks it is not needful to speak in detail; indeed, each day that came was so much a repetition of the one that had gone before it, that there would be but little to record. Tom rarely ventured to visit his friend till after his father and the rest of the household had retired for the night. It was a joyful sound to Gerald when he heard the click of the panel and knew that for two or three hours to come he should be a free man. Then through the silent shut-up house the two men would steal like burglars to Tom's room. Once there, they felt safe; for the rest of the family and the servants slept in different wings of the rambling old house. On nights when there was no moon, or when it was overcast, the two friends paced a certain pleached alley of the lower garden for an hour at a time; it was the only exercise Gerald was able to obtain. After that they sat and smoked and talked in Tom's room till the clock struck three, which was the signal for Gerald's return to his dungeon. Twice each week Mr Starkie rode over to the Towers, acting the part of postman between husband and wife, in addition to that of general purveyor of news.

So day after day passed without bringing the murderer of Von Rosenberg to light or tending in anyway to weaken the force of the circumstantial evidence accumulated against Gerald. It seemed, indeed, as if the police had made up their minds that Mr Brooke, and he alone, must be the guilty man, directing all their efforts towards his capture, and listening with incredulous ears to such persons as suggested that, after all, it was just possible he might not be the individual they wanted.

'If he isn't guilty, why don't he show up? Why has he gone and hid himself where nobody can find him?' was Mr Drumley's invariable rejoinder, when any such suggestions happened to be ventilated in his presence. Such questions were difficult to answer.

Many a time during those weeks of slow torture, as he sat brooding in his underground chamber by the dismal light of a couple of candles, did Gerald wish with all his heart that he had not yielded to his wife's entreaties, but had stayed, and braved the thing out to the bitter end.

Clara, meanwhile, was doing all that it was possible for a woman, circumstanced as she was, to do. When a week had passed and nothing tending to prove her husband's innocence had been brought to light, she did that which Mr George Crofton proposed doing, that is to say, she engaged the services of an experienced private detective. The man came, listened respectfully to all she had to say, and promised that his best endeavours should be at her service; but after his visit, day succeeded day without bringing any ray of comfort to the young wife's aching heart. Could it be possible, she sometimes asked herself, a little later on, that this subtle individual, while to all appearance falling in with her views, really believed in her husband's guilt as strongly as Mr Drumley did, and while quite willing to humour her and spend her money, was in his

heart impressed with the futility of looking elsewhere for the criminal? It was a weary time, full of heartache in the present, and with a future that began to loom more darkly as day followed day in slow and sad procession.

By-and-by there came a certain night when Tom Starkie met his guest with a very long and gloomy visage. His news was quickly told. His father had suddenly made up his mind to start at once for one of the German spas, and insisted upon Tom's accompanying him. 'And if I go, my dear Brooke--and I'm afraid I can't get out of it--what's to become of you?'

'I must flit,' answered Gerald with a shrug; 'there's no help for it.' He almost hailed the prospect as a relief, so unutterably weary was he becoming of the terrible monotony of his present mode of life; but the question of course was, Whither was he to go? At length, after the two men had smoked some half-dozen pipes each, a happy thought came to Gerald. He called to mind that he had another friend on whose secrecy and good faith he could rely, and who, he felt sure, would befriend him in his present strait, if it were in anyway possible for him to do so. The name of the friend in question was Roger Chamfrey.

A few hours later, Tom Starkie set out for London in search of Mr Chamfrey, whom he fortunately found at his club. The latter had of course read everything that had appeared in the newspapers respecting Von Rosenberg's mysterious death, and Tom found him to be as firm a believer in Gerald's innocence as he himself was.

'I've got the very thing to suit poor Brooke,' he said. 'The situation of second-keeper is vacant on a certain moor which I rent in a wild and lonely part of Yorkshire, and Brooke will be as safe there as he would be in the heart of Africa. I will give him a letter to Timley the head-keeper, who is a very decent sort of fellow, so worded that Brooke shall receive every possible consideration while yet ostensibly filling the part of assistant-keeper. What's more easy than to hint that our friend is a young gentleman of position who has quarrelled with his family, but that in the course of a little time he will come into a large property?' And Mr Chamfrey laughed.

So the letter in question was written and given to Mr Starkie, together with many kind messages for Gerald.

Four days later, Gerald reached his new refuge in safety. What means he adopted to escape recognition by the way, and by what circuitous routes he travelled, need not be specified here. It was indeed a wild and desolate tract of country in which he found himself; but in that fact lay his safety. Timley received him kindly; and when he had read and digested his employer's letter, he at once proceeded to turn himself and his wife out of the best bedroom in his cottage, and allotted the same to his new assistant, greatly to the surprise and disgust of his better-half, until he had pacified her by a few sentences whispered in her ear, after which she became all smiles and graciousness, and seemed as if she could not do enough to make Mr Davis comfortable. When they were alone, or when no one was within earshot, Timley invariably addressed Gerald as 'Sir.'

The free open-air life he now led did much towards improving Gerald's health and spirits. Once a week he wrote to his wife, and once a week he received a long letter in return. His letters to her were addressed under an assumed name to be left till called for at the post-office of a little town some dozen miles from the Towers. From this place they were fetched by Margery, who made the journey by rail, and who at the same time dropped a return letter into the box addressed to 'Mr Davis' the keeper.

So time went on till the 12th of August came round, about which date Timley had notice that in the course of the following week his master would arrive accompanied by a number of friends. At the last minute, however, Mr Chamfreys was detained by important business, and his friends arrived without him. All was now bustle and excitement, and Gerald found quite enough to do. The first and second days' shooting passed off admirably. The weather was perfect, birds were plentiful, and everybody was in high good-humour. Gerald acted his part to perfection—at least Timley told him so. All fear of recognition by any of the visitors had passed away, and on the third morning after their arrival he caught himself humming an air from *Lucia* while cleaning the barrel of his gun outside the cottage door. Hearing a footstep on the garden path, he turned his head quickly, and found himself confronted by a man who had been in his own service only some eight or nine months previously. The two stood staring at each other for a few moments in silence. It was at once evident to Gerald that, despite the change in his appearance, he was recognised. Before either had spoken a word Timley came out of the cottage. Then the man delivered his message, which was from one of the visitors at the Lodge in whose service he now was. Then, after another stare at Gerald, who still went on cleaning his gun, the man turned and went.

Twelve hours later, Gerald Brooke—clean shaven except for a small moustache which was dyed black, and with a black wig over his own closely cropped hair—was flying southward in the night express. Mr Starkie, who had returned from the Continent by this time, and to whom he had telegraphed under an assumed name, previously agreed on, met him at the London terminus. The conference between the two friends was a long one. It resulted in Gerald coming to the decision that he would take up his abode in London itself, at least for some time to come, as being, all things considered, as safe a hiding-place as any for a man circumstanced as he was. It was, besides, becoming requisite that some decision should be arrived at with regard to matters at the Towers. Clara was still there; but although she had cut down the household expenses to the lowest possible limits, her supply of ready-money was dwindling away; and when that was gone, where was more to come from? With Gerald's disappearance his income had disappeared too. It was an impossibility for him to draw a cheque, or receive a shilling of rent from any of his tenants, while matters with him remained as they were. Then, again, Clara's long separation from her husband, and the many weeks of anxiety she had undergone, were wearing away both her health and her spirits. 'Only let

us be together again, darling—that is all I crave,' she wrote to her husband. 'Two little rooms in some back street will seem like a palace if only you are with me.'

Thus it fell out that on a certain afternoon about a week after Gerald's arrival in London, two ladies, both of them closely veiled, who had been hunting for apartments all morning, and were utterly disheartened and tired out by their want of success, stood for a few moments gazing into a pastry-cook's window in Tottenham Court Road. As she did so, the younger lady raised her veil. Next instant she was startled by hearing some one say in French: 'O papa, papa, here is the beautiful lady who gave me the cakes and fruit at that grand house in the country!'

Clara dropped her veil and turned. She recognised the little speaker at once, although he no longer wore his mountebank's dress. There, too, was Picot himself, who had come to a stand a few yards away while he lighted a cigarette.

Tired and anxious though she was, Clara would not go without speaking to the boy. 'So you have not forgotten me, Henri,' she said, 'nor the cakes either? Would you not like some more cakes to-day?'

For answer he lifted one of her hands to his lips and kissed it.

When Mrs Brooke and Henri came out of the shop they found Miss Primby and M. Picot deep in conversation. The mountebank was dressed quite smartly to-day, and had a flower in his button-hole. As Miss Primby said to her niece afterwards: 'Although the poor man may be nothing but a tumbler, he is the essence of gallantry and politeness.'

After a few words had passed between Clara and Picot, some impulse—she could never afterwards have told whence it originated—prompted her to say to him: 'My aunt and I are in London to-day on rather a peculiar errand. We are here to find apartments for—for some dear friends of ours who a little time ago were rich, but who are now very poor. We have been going about all morning, but cannot succeed in finding what we require. It is just possible, monsieur, that you with your knowledge of London may be able to assist us.'

'I am entirely at madame's service,' answered Picot as he raised his hat for a moment. 'Is it furnished apartments that madame requires?'

'Yes—four or five furnished rooms at a moderate rent, and, if possible, not more than a mile from where we are now.'

Picot considered for a moment or two, then he said: 'I remind myself of a place that will, I think, suit madame. The landlord is a compatriot of my own; he is honest man; he will not cheat his lodgers. If madame would like to see the apartments'—

'By all means, if you recommend them, monsieur.'

'Then I will give madame the address.' He tore a leaf out of his pocket-book, pencilled down a couple of lines, and handed the paper to Mrs Brooke with an elaborate bow. At Clara's request he then hailed a passing cab; then both the ladies, having kissed Henri and shaken hands with Picot, were driven away.

Henri, as he stood gazing after the cab, said to

his father: 'Are the angels as beautiful as that lady, papa?'

'That is more than I can say, *mon p'tit*,' replied the mountebank with a laugh. 'When I have seen an angel, I shall be able to tell thee.'

(To be continued.)

THE NOVEMBER METEORS.

UNTIL a few years ago, this term was sufficiently precise as applied to that shower of meteoric bodies which appears in abundance in the middle of November at intervals of thirty-three or thirty-four years, being seen for two or three years in succession, after which a few, and a few only, are visible about the same date until another such period has elapsed. That which led to the recognition of their being not terrestrial but cosmical phenomena—belonging to interplanetary regions—was the fact, the first notice of which is due to Humboldt in 1799, that they always emanate from the same place amongst the stars, which of course alters its apparent position regarding the points of the compass as the night advances, in consequence of the earth's rotation. In the year just alluded to, a grand display of these meteors was noticed in South America in the early morning of November 13. An equally fine shower was seen, chiefly on the Atlantic coast of North America, on the same day in 1833, a less striking one having been witnessed in part of Europe and in Arabia in 1832.

It was not, however, until 1864—that another such shower was nearly due—that the subject was taken up by Professor H. A. Newton, of Yale College, Connecticut, who succeeded in showing, by decisive historic evidence, that similar showers had been manifested at these intervals during many centuries, occurring, however, about two days later each century. Account was of course taken in the discussion that the change of style in the sixteenth—in England the eighteenth—century made the progressive greater lateness of date appear more rapid than it really was when only very early and recent observations were compared with each other. This slow alteration of date was shown by Professor Adams to be the effect of perturbations produced by the attraction of the planets, and it became clear that the meteors composed, in fact, a vast shoal revolving in a ring—one portion of which was much thicker than the rest—round the sun in about thirty-three and a quarter years, the earth in its annual orbit passing through this stream about the 13th of the month of November. A recurrence, therefore, of the phenomenon in abundance was confidently predicted for that date in the year 1866; nor did it fail to take place. The display, indeed, on this occasion was especially grand, and formed a sight which none who saw it can ever forget. It was repeated, but in much smaller abundance, in the following year, since which but few meteors have been seen at the time in question, the earth passing through parts of the ring in which those bodies are but sparsely scattered, though in some years they have been more numerous than in others. No one who has examined the subject doubts that brilliant displays will occur towards the end of the century, in 1899 and 1900.

But we commenced by alluding to the fact that more than one fine periodic shower of meteors is now recognised as taking place in the month of November. That of which we have hitherto been speaking forms the stream called the Leonids, because the meteors of which it is composed always appear to radiate from a point in the heavens in the constellation Leo. We must now devote a few words to the other, which appears at intervals of several years very nearly at the end of November, the meteors of which radiate from the constellation Andromeda, and are therefore called Andromedes. Unlike the former, these manifest themselves a little earlier on each occasion, and were first noticed as taking place early in the month of December. However, the first really grand display took place on the 27th of November 1872. It would seem that they recur at intervals of thirteen years, and another magnificent shower was seen on the evening of the same date in the year 1885. But whereas the periodicity of the other stream was the first thing noticed about it, the periodicity of this was anticipated from a similar circumstance connected with its regular appearance.

Professor Schiaparelli of Milan was the first to call attention to the fact that the meteoric stream of the 9-10th of August—called that of the Perseids because the meteors belonging to it radiate from a point in the constellation Perseus—moves in the same orbit with that of a small comet which was discovered about the end of 1865 and was nearest the sun in January 1866. That comet also revolves in a period of about thirty-three and a quarter years; and it would seem that it is in fact the largest member of the stream of meteors which follow in its wake and are distributed, with more uniformity than the Leonids in their orbit, along the whole length of its elliptic path. The comet is probably undergoing a process of disintegration; and though it will be looked for in 1899, it is not likely that it will be seen as a comet at many more appearances. Shortly after Schiaparelli had made this suggestive discovery, it was remarked that the Leonids or meteors of the middle of November also move in the same orbit as a comet which has only been seen in the year 1862, and appears to occupy about one hundred and twenty-four years in revolving round the sun.

Now, a very interesting comet, as it afterwards proved to be, was discovered in France by Montaigne in the year 1772. Its periodicity, however, was not recognised until after its rediscovery in Bohemia by an Austrian officer named Biela, in the year 1826, when it was found that it was moving in an elliptic orbit with a period which it took only about six and a half years to complete. (It had indeed been observed in 1805, but supposed then also to be a new comet.) Its period being thus known, it was seen again in 1832; and though at the next return it escaped observation, being unfavourably placed, was also observed in the winter of 1845-46. On this occasion it was found to have separated into two companion comets of different and fluctuating brightnesses; and the two portions returned in company, but at a somewhat greater distance from each other, in 1852. Since then, nothing has been seen of this remarkable comet or comets, its particles having apparently too little mutual attrac-

tion to remain united. But it is known that the earth crosses its or their orbit about the end of November, and that bodies moving in that orbit would appear to come from a point in the constellation Andromeda. Meteors, therefore, being seen to radiate from that part of the sky first about the beginning of December, and afterwards at the end of November, it was concluded that they had the same sort of connection with Biela's comet that the meteors of November 13 and of August 9-10 had with the comets of which we have spoken. Hence, as the comet's period was six and a half years in length, it would, at intervals of two periods, or thirteen years, be near that part of its orbit traversed by the earth; and if the meteors were, as was reasonable to suppose, thickest there, a fine display of them would be seen at times separated by that duration. Accordingly, the grand shower of November 27, 1872, led to the expectation of another on the same date in 1885, which, as we have already remarked, did really take place. Another will be looked forward to in 1898; but if the meteors become as time passes on more uniformly distributed through the orbit, a shower will ultimately occur every year about that date. That it is a little earlier each time, whilst the display of November 13 is a little later, carries with it the consequence that the two showers will, about three hundred years hence, take place on the same night—that is, on that of the 20th of November.

It should be noticed before concluding that there is a difference in the direction of motion of the meteors forming the Leonids of the middle and the Andromedes of the end of November. The latter move in the same direction as the earth, and overtake it in consequence of their greater speed when in the part of their orbit nearest the sun; the former move in the reverse direction to the earth and collide with it, as a down-train would with an up-train on the same metals. As a consequence, the relative velocity of the Leonid meteors is much greater than that of the Andromedes. The Perseids, and the comet (1862, iii.) with which they appear to be connected, move, like the Leonids, in the opposite direction to that of the earth.

JAMES PINK'S LAST ILLUSION.

'It is, I suppose, as likely to come to anything as your previous—fascinations. You are certainly an odd person, James.'

'Oh no, Maria: this is quite different. I assure you I have learnt caution with experience; and if the world has taught me no other lesson, it has taught me that the eyes of a man are really the least trustworthy of the faculties with which he has been endowed.'

'What nonsense! As if *you* are ever likely to come to such a pitch of wisdom. Why, it was but last year, at Obal, you remember, that you fell in love with a woman who was a grandmother over and over again. She tricked you as easily as if you had been a babe: what with her paint and powder, false hair and false teeth. And I can't say you did yourself credit when you vowed to me that you were about to offer your hand and

what may remain of your heart to a person who proved to be two-thirds bereft of her wits. I don't know which county-asylum she now resides in; but I daresay you know: and indeed, knowing you as I do, it really would not surprise me to be told that you were still in correspondence with her. There's one thing: the letters on either side would have about an equal share of sense in them.'

'You are too monstrous, Maria, to go on in that way,' protested James.

'And now,' continued his sister, 'you come with a fresh story about a siren sitting somewhere at the receipt of custom, with the loveliest complexion you ever beheld, and a demeanour the perfection of modesty, simplicity, and grace. A deal you know about complexions; though I warrant if it is given to men to know the qualities they most excel in, you ought to be a remarkable judge of the creature's simplicity.'

It was in this way. James Pink, who was a country lawyer under no obligation to work for a livelihood, passed three or four months of each year of his life in travelling about the world. During his travels, he periodically fell in love. He was accompanied by his sister Maria, a lady of forty-five to fifty, who sympathised with none of her brother's tastes. Least of all, was she by nature disposed to view charitably his love fancies. In fact, they caused her intense irritation. Why this should have been so, we cannot tell. But the truth was that no sooner did her brother begin, timidly enough, one or other of his stories about a new impression made upon his heart, than she was wont to toss her head, and otherwise manifest a little temper, blamable in a girl of twelve or thirteen, but very singular in a woman of mature age.

Upon this occasion they were at Naples. It was spring; and Easter. They had viewed with complacency the pet lambs which the Neapolitan children are wont to lead about the streets during the latter days of Lent, fattening them upon grass, cabbage leaves, or what not, in readiness for the butcher's knife on Easter eve. Neither the one nor the other of them had grown at all cosmopolitan in the course of their ten or twelve years' travel upon the Continent. Each regarded with horror those customs of a country which differed from the customs of their own small village in the north of England.

'They do not that sort of thing in Carsforth,' was with James or Maria Pink a common sort of condemnation, indicative of the extreme of dispraise.

If either of them was disposed to be at all liberal in his or her estimate of a world which differed from Carsforth, it was James Pink. But he was cautious to keep his opinions to himself.

Thus they had driven to and fro in Naples, with their eyes fixed upon the smoke of Vesuvius, when Vesuvius was in sight, and at other times with expressions of pain upon their honest faces, as they remarked the grime and filth which accompany the colour and vivacity of Neapolitan life. Maria Pink on these occasions journeyed with a small golden smelling-bottle in her hand; and however picturesque was this or that grouping of lads or lasses, ragged men and ragged women, upon the hot pavement of Santa Lucia, which

she was requested by the car-driver to look upon, she never so far forgot herself as to omit to use her salts while she inspected through her glasses the details of the curious scene.

'For any sake, don't let us stay here,' she would remark to her brother. 'There's typhus in the air upon this spot, if typhus exists anywhere!'

Imagine, then, this poor lady's disquietude when one morning her brother announced to her, with sufficient timidity and humility indeed, that he was enamoured afresh—this time of a woman resident in the city which appalled her so much from a social aspect.

The declaration was made while they were at breakfast in the *Hôtel Vesuvius*. It did not come out point blank. James had trifled with his egg in a nervous manner, and his sister had asked him what ailed him. She was so positive that the drains of the hotel were out of order, and that her brother's trouble was due to blood-poisoning or fever in its embryonic stage, that he allayed her suspicions by telling her what he would much have preferred to keep to himself. She laughed at first, in a stiff way; but subsequently, when she perceived that the affair had gone too deep to be removed by the first charge of ridicule, she tried satire and informal abuse. And she was not a little astonished when she found that for once her brother was able to stand against all her weapons and all her cajoleries. There was that in the eyes of James Pink which made her darts glance from him and leave him untouched.

'I tell you what, James; I think we had better go to Capri at once. I find Naples quite oppressively hot. We will take the boat to-morrow morning.' She said this as though her suggestion were a decision which could not be contested.

Her brother, however, was equal to the situation. 'It would be inconvenient for me, dear Maria, just at present. Next week would be much better. Then I should be able to place myself entirely at your disposal.'

For reply, Miss Pink rose from the table, and walked out of the breakfast room. This sounds very trivial. But you should have seen the look which she cast upon her brother ere she left him; and you should have seen the lady's demeanour as she turned to go. There was something terribly imperious about one and the other alike. And the other people in the hotel, who were witnesses of the departure, at once assumed that James and his sister were an ill-mated man and wife, and that James deserved the utmost compassion that man or woman may tender to man.

Left alone, however, James Pink showed none of the depression of the man who is in chains to his wife, and who has just had a new bond of pain set upon him. He watched his sister depart as if she were somebody else's sister, and not his Maria. Then, with the same look of elation which had perplexed and disturbed Miss Pink, he challenged the room to convict him of aught akin to misery. Moreover, he called for the waiter, and gave certain orders about the evening's dinner in a tone of resolution that raised him tenfold in the waiter's esteem, and altered the opinion which the other guests in the hotel had casually formed about him.

Nor was this the limit of his metamorphosis. He asked for cigarettes—a pernicious invention

which hitherto he had been content to execrate. And, having allowed the waiter to light one for him, while he held it in his mouth, he left the room with—of course speaking in metaphor—banners flying.

Miss Pink was stupefied to see her brother pass into the hall of the hotel smoking a cigarette. She had left the door of the ladies' room open on purpose that she might estimate exactly the acuteness of the suffering she had caused James by the manifestation of her displeasure; that she might see him in his despondency as soon as possible, and perhaps, there and then, make proposals for reconciliation. And this was what met her eyes! But ere she could recover her equanimity, her brother had disappeared. A whiff of smoke was all that remained of him. It was very delicate aromatic smoke; but did that make the sin any the less flagrant?

In the meantime, James Pink was walking towards the city. He was hailed by countless carmen, who cracked their whips at him and cried 'Di!' (I say!) in the cool way that is characteristic of the Neapolitan jarvey. There was no doubting his nationality. His gait proclaimed it, no less than his broad red innocent face, and his white hat above. And who but an Englishman of James Pink's type, or a German of the burgher class, would have gone about the fashionable part of Naples with a large umbrella of green silk with a white lining? But of this and the kindred distractions of the streets, our friend took no heed. He walked with an air of absorption, looking straight before him, and holding his head rather high. Nor was it possible to misconstrue the light in his eyes. He was the personification of a contented man, going whither he felt assurance of raising his contentment to ecstasy.

It was marvellous to see with what skill this man, ordinarily the perfection of clumsiness, found a safe path between the noses of the horses of the different cars which, at the crossing by the palace and the theatre San Carlo, hotly competed for his patronage. And it was equally wonderful that he could go at the pace he did, with so hot a sun in the heavens. But in truth James Pink had that within him which made him indifferent to externals. There was a fair portrait in his mind, which attracted all his energies, mental and physical, as a lodestone gathers to itself envolving shreds of steel. And the god Cupid, who generally knows what he is about, though some hold him to be blind, protected him through all the dangers which encompassed him.

Where the road widened into a spacious public square, the lawyer abruptly turned west and left it. The sea was again before him, blue and radiant. Beyond was the white fringe of the myriad of houses which bind the Bay of Naples like a snowy marge of sand. And over the houses swelled Vesuvius, clear and entrancing on this bright day; methodically puffing its smoke toward the purple shadow of the island of Capri, a light sketch on the horizon. Closer at hand was to be seen the conventional furniture of a busy port; a maze of masts, with here and there a red or a black funnel in their midst, and a multitude of men and boys lounging against walls and railings, and, the stout columns of granite sunk in the piers as convenient tether for the harbour

craft. There was uproar enough, in all conscience. All ports are noisy; but the tumult of the port of Naples may be called transcendent.

A hundred yards or so from the gate of the port there was a little white marble seat under a tree. The seat commanded a view of a low building, of a temporary kind, erected between it and the bay. In the doorway of this building, an orchestral organ was to be seen—and from the coloured posters outside it was evident that here was a show of a kind to be found alike in the cities of Europe and Timbuctoo. It was in fact a circus. From the organ loud harmonies proceeded forth upon the charmed air, and voluble were the rapturous comments of the Neapolitans who enjoyed this gratuitous diversion. The organ was not automatic. A large handle was turned with untiring energy by a woman fit to extort admiration from a traveller to whom no type of beauty is unknown. Such symmetry, lissomeness, and grace of movement! Long black hair! large unblinking eyes, worthy of the laud they looked upon! The most bewitching complexion in the world! Teeth, mouth, nose, brow, and chin all conceived by nature as if she had worked by the light of the Book of Beauty!

James Pink sat on the marble seat and contemplated this lovely creature. Middle-aged man that he was, his heart beat as if it were disordered. You would have said he had a touch of palsy, if you could have seen the twitching of his mouth and fingers. And he winked again and again, as if the sun were in his eyes instead of held at a distance by the tree above him. After a time, our hero rose reluctantly, sighed, wiped his face with his silk pocket-handkerchief, and departed. He knew better than to shatter or risk the shatterment of his ideal by an interview, until he was well prepared for the consequences, might they be ever so disastrous. But he was not, therefore, the less liberal in his praise. He lauded her loveliness and her figure until he was again at the portal of the *Hôtel Vesuve*.

It was really absurd to mark Miss Pink's conduct towards her brother during the remainder of that day. She was supercilious, deferential, tender, and commanding, each in succession. But all her moods were powerless to affect her brother. He was as little moved by them as if he had been a rock. His voice was strong and decided when he replied to her questions. And, moreover, Miss Pink was exasperated to find that he was sufficiently changed to be able to treat her with a certain amount of condescension. In effect, her brother behaved towards her as a political minister might behave to a small suitor who pestered him with demands in the midst of his business, but who had a certain claim upon him for civil treatment which he might not repudiate.

'I can bear this no longer, James,' said Maria in the evening, after dinner. She felt some terror lest her brother should go off again with a cigarette in his mouth. Had he repeated this iniquity, she was resolved to cause a scene, in public or private, it did not matter which. But no. With an air of philosophic abstraction that proclaimed his peace of mind, he had followed contentedly at her heels when she had left the table to retire to their private sitting-room. She

had thus the less cause for complaint. Yet she was too aggrieved to perceive this.

'What cannot you bear, Maria? Is not the service of the hotel good enough for you?'

'The service of the fiddlestick! You know that I am concerned about a very different matter. It is your own welfare, James, that is at stake: and, heaven knows, I have not watched over you from the time you were a helpless little babe—I mean, of course, when we were babes together—I say I have not been for twenty years in the position of guardian towards you, without acquiring a strict and conscientious estimate of my responsibility.'

'Yes, yes,' observed James Pink, as if he were, from a sense of duty, encouraging a diffident client to unbosom himself of his troubles.

'Be silent, James—with your Yes, Yeses!' exclaimed Miss Pink. 'I will not be interrupted! Who is she, I say? Tell me at once where I may find the creature, and put an end to the tragedy; for it is tragic, indeed, in its effect upon your heart, James, which I had come to regard as soft, tender, and humane.'

'Maria,' said James Pink benignly, when his sister paused, 'I do not admit that there is reason in your plea; but let that pass. The attachment is of the purest—the most Platonic kind. I have never stood within twenty paces of—of this divine being'—

'And yet you are fool enough to suppose she is one of Nature's beauties,' observed Miss Pink.

'It is my turn to cry "Be silent!" Maria,' replied James Pink. 'It is trifling with the highest, the noblest of human sentiments, thus to cast cold water upon the blossoms of hope. You shall see her for yourself, sister. That will assuage your enmity, if anything will.'

'I can quite believe it,' said Miss Pink. 'Nothing could please me more. The sooner the affair is ended, the sooner we shall return to our earlier and more comfortable condition as an affectionate brother and an affectionate sister, each anxious only to promote the other's happiness.'

'Hum!' murmured the lawyer, stroking his chin, and with, for the moment, a recurrence of the light in his eyes.

'Go to bed, James,' said Miss Pink abruptly; 'we have had enough excitement for one day.'

Without another word and with but a single kiss of salutation, James Pink took up a candle and went off to bed. He dreamed for eight hours of his fair one, and awoke the next morning still with exultation in his heart.

Miss Pink on her part sat and read for an hour and a half after she had wished her brother 'Good-night'; and retired confident that she had the reins of victory once again in her sinewy firm hands.

'Well!' she said, when they sat opposite to each other at breakfast again. 'I see, James, that you are still a little foolish. Let us get the illusion over without loss of time.'

'The illusion, indeed!' said James Pink indignantly. 'I am going there immediately after breakfast. If you choose you may accompany me.'

'I ask for nothing better,' remarked Miss Pink with emphasis. She straightway left the room, and, ere James had rid himself of the fears which came upon him with his sister's words of acquiescence in his impetuous proposal, she had returned,

bonneted and gloved, and carrying in her hand a red parasol with a long stout stick. Humbly, for anxiety oppressed him and a sense of approaching evil, James Pink left the hotel with his sister. They walked in silence. Ere long, the music of the distant orchestra was audible. James held his head up. 'Be patient, Maria,' he pleaded. 'We are nearly there.'

'I am glad to hear it,' was her reply. 'The sun is insufferable; and it is due to your absurdity that we are risking our lives beneath it.'

'And so this is your *innamorata*!' remarked Miss Pink when, at James's invitation, she had seated herself on the marble bench.

'Yes, I confess it; and I am proud of the attachment. It ennobles me,' said James.

Miss Pink put up her glasses, the better to view the action and countenance of the beautiful Italian; then she dropped them, and looked at her brother in a manner he will never forget. 'You must allow me to break my promise,' she said. She rose, approached the show, advanced into the vestibule, where stood the orchestra, the woman who received the money, the *siren* of the music herself. Disregarding the outstretched hand of the one woman who demanded the entrance fee, Miss Pink stepped up to the other woman, examined her closely, touched her, and turned away. 'You are certainly the most consummate fool on the face of the earth, James,' she said frigidly, when she rejoined her brother, who had hurried after her. 'You must take to spectacles: the creature is wax!'

THANKSGIVING DAY IN THE STATES.

'In acknowledgment of all that God has done for us as a nation, and to the end that, on an appointed day, the united prayers and praise of a grateful country may reach the Throne of Grace, I, — — —, President of the United States, do hereby designate and set apart Thursday, the — day of November inst., as a day of Thanksgiving and Prayer, to be kept and observed throughout the land.' So runs in part and form the admonition which annually issues from the President to the people of the United States, and is echoed subsequently and more locally by the Governors of the various States to those under their immediate charge. The last Thursday in November is thus observed as a general holiday, a day of national Thanksgiving for the benefits and progress of the past year.

It is a beautiful institution; and round its observance cluster some of the sweetest memories of the past; while through it shines the deep religious instinct which lies beneath the superficial gloss of American social and commercial life. The day has been universally kept through many years, even in a more heartfelt manner and with more genuineness than Christmas; indeed, to certain sections of the nation, notably New England, it has always been the one great family festival of the year.

On the evening preceding the appointed day may be seen in most large cities, and also, though to a less extent, in most country villages, that

pleasant anticipatory activity and excitement that is witnessed in England only at Christmas-time. The merchant, silent and preoccupied in his office during the day, glances frequently with impatient inquiry at the slow-moving hands of the clock, as if, were it not for the evil example to his subordinates, he would gladly anticipate his customary hour for departure, and hurry home to a dwelling made bright by the charms of family life. The clerk behind the shop counter, though he knows that the general holiday will be a cause to detain him past his usual time, moves about his business, and supplies the wants of his unusual crowd of customers with an added cheeriness born of the heartfelt associations of the day. The office-boy as he sweeps out his domain whistles with especial shrillness and gaiety; and if his work is not so thoroughly done as usual, the sober, seedy book-keeper, as he puts on his overcoat, has his mind too full of the eager, happy little faces which will surround his humble board on the morrow to check the lad's exuberance or to chide his remissness.

The streets are filled with a noisy, pushing, bustling crowd; and many are the forms passing beneath the flaming gas jets laden with parcels whose shapes plainly betray their contents. The brilliantly lighted shops are crammed with customers inspecting, haggling, and pricing; but usually going out with a satisfaction and good-humour that are eminently shared by the shop-keeper.

And round the windows of the toyshops, gay with novelties, may often be seen a group which excites feelings of mingled pleasure and sadness: the children of the streets are there with their small arms burdened with the last editions of the evening papers, while they at intervals reluctantly break away to press upon the hurrying passengers, to return again in a moment with increased eagerness and more noisy criticism. Their faces betray nothing but the intensest enjoyment of the mere sight of pleasure they may not possess. How long will they keep their innocent unselfishness? or how soon will they learn to pass such sights with a bitter comparison or a jealous sneer? For there are despairing poor even in free America; and one may sometimes catch in the silence of the garret the faint sobbing murmur of the *Song of the Shirt* even in this land of liberty, crooned by those who are working from darkness to darkness in 'poverty, hunger, and dirt.'

But there are other and even more interesting figures in the scurrying tide of humanity. One may get a glimpse here and there of forms that wear the marks of a singular and sometimes a hard life, gazing about them with a look and a smile that are at once familiar and strange. Many are the changes which they probably note in their native city; and great is the difference in their eyes, accustomed to the sights and sounds of distant lands, between this noisy, whirling pandemonium and the quiet old town that has occupied one of the tenderest spots in their memory, as they tended the water-trougs in the Western mines, or rolled themselves in their blankets around the blazing pile in the clearing, with the strangeness of the forest all about them. For this is the time when the wanderers return, when those who have branched off into the world to make their own

way and to carry their own burdens come back to the old home, 'there to grow young and loving again among the endearing mementoes of childhood.' And so they pass on, each bent on his own destination, and filled with his own story, out of the windy street, with its flickering gaslight, into the lighted comfort of the home, or the barren destitution of the garret.

The picture of the celebration of Thanksgiving Day in an old New England household is one which it would be difficult to eclipse in its thorough simplicity, its genuine hospitality, and its sweet and loving communion between members of a family who have perhaps been separated during the past year. It fills the place, left vacant in the calendar, by the non-observance or the decreasing value in American eyes of the old English Christmas; and though it cannot have to English hearts the associations of the latter, unaccompanied as it is by the time-honoured holly and mistletoe and the ancient Yule-log, yet it has a peculiar individual interest of its own, which carries one irresistibly back to the times of the early colonists with their quaint garb and prim Puritan ways.

A short description of such a Thanksgiving so kept might not be unwelcome, and would serve to a certain degree as a type of what, unhappily, like our own Christmas, is fast retreating into the past, and what must eventually, under the harsh utilitarianism of modern times, eventually become entirely obsolete. The family was one which dates back to long before the Revolution, and many are the stories and legends which have been handed down of their early ancestors among the direct descendants of the Pilgrim Fathers; and great is the family pride which clusters about the consciousness of their ancient privileges. The old gentleman, one of the true type of native Americans, with something of the earnest, courageous, nonconformist spirit of the Puritans still lingering in his ageing frame, was full of reminiscences; and as he told the story of the Thanksgivings of his boyhood, and described with an eloquence born of emotion the country round Boston as he knew it then, one could appreciate that priceless possession of old age, a clear and undisturbed memory. The picture which he drew of the old homestead—now built over by rows of cheap lodging-houses, in one of the most thriving suburban districts of Boston—with the barns and the cattle; the brown orchard encircling the plain severity of the white house; the long approach through the fields; the old-fashioned garden, glowing with its last tribute to the Indian summer; the large well-swept kitchen, with its oaken settles and brick fireplace, and the long lines of brightly polished houseware—gave one a new insight into a long past age, connected only with the present through the medium of a few such venerable lives, fast tottering on to their last oblivion and well-earned rest.

The old lady, too, is one of the same worthy school; a kind, motherly, old dame, who, in her simple open-heartedness and genial activity, seems to cast a sort of halo of homely comfort around her, and carry a brisk air of cheeriness into all her relations with others. She was evidently disturbed in mind as to the fate of the Thanksgiving feast, and many were the bustling journeys she made to the kitchen to superintend

the actions of the hired girl, who, as she expressed it, 'could only cook these modern pastry fol-de-rols.'

And the event of the day, the Thanksgiving dinner, what a gorgeous spread was that! The old family table fairly creaked and groaned beneath the load of substantial dishes, as if its aged strength were taxed to the utmost by this unexpected revival of the past. The old family china and table-linen, too, reverently taken out of the oak-chest and divested of their wrappings and sprigs of lavender, were renovated for the occasion, and seemed to shine with enhanced gloss and brilliancy in appreciation of long-forgotten usages. The turkey, with its indispensable attribute, cranberry sauce, was basted to a delicious brown, and hissed and sizzled in its gravy as it was placed on the table. Its arrival was the signal for the solemn opening by the head of the house of the earthenware cider jug; and keen was the enjoyment depicted on the old gentleman's face as he sent the glasses, filled with the cool amber liquid, circling round the table. The chicken-pie, large and succulent, the various arrangements of squash, the three indispensable sorts of pie—'open-topped, cross-barred, and kivered'—all were there in their largest and most delicious forms; and the hospitable hostess seemed quite hurt, and apprehensive that all was not right, if exhausted nature refused to have more than twice of each dish. There she sat at the head of the table beaming warmth and comfort into every heart; only too happy if some one would pause in the general engrossment to remark on the excellence of some particular dish. Evidently the dinner was the event of the day with her; and after it was over, like Othello, her occupation was gone, and she rested, satisfied that her best had been well appreciated, and conscious of the placing of one more landmark on the highway of a long life.

Then in the evening, 'twixt the gloaming and the mirk,' we gathered round the great open fireplace, on which blazed and crackled a huge wood-fire—the collateral descendant of the Yule-log; and listened to more reminiscences from the old gentleman; while presently, after much urging and many protestations and nervous flutterings, the eldest daughter, as kind-hearted a soul as ever lived, not soured in mind by the non-fulfilment of all her youthful dreams, was induced to show somewhat of her ancient skill on the pianoforte. She assured us, with considerable embarrassment, that 'she really had not practised for several years, and would we please excuse all mistakes.' Being reassured, she turned to the instrument; and the discordant notes struck from its rickety interior seemed to fill the darkened room with a subdued and appropriate melody; and over the face of the old man there passed with the flickering firelight the chastened remembrance of years still more distant than those he had told us about, brought back by the jangling chords of the *Old Oaken Bucket*.

And so the evening wore away, with jests and stories among the elders, and music and innocent mirth among the younger ones, varied by the eating of 'phillipenas' and the 'pulling' of caddy; until Thanksgiving Day was again with the past, and the party retired to pass through the intermediate land of slumber into another year;

which also will assuredly end in a Thanksgiving Day, but with what changes in the fireside circle, with what places vacant, or what others added, who can tell?

THE MONTH: SCIENCE AND ARTS.

THE meeting of the British Association marks for us every year the progress of all the different branches of science, and enables those who have neither time nor inclination to study the 'proceedings' issued by our learned Societies, to form a general idea of what is going on in the professorial world. There were many excellent addresses in the various sections, and papers were read on a variety of subjects; and if their perusal should seem to suggest dullness, it is only because no very important discovery or invention has been brought forward during the past twelve months. Yet certain of the sectional addresses possessed both interest and novelty; and there is little doubt that this meeting at Newcastle has been in every way a success. The discussion on heredity evoked perhaps as much interest as any, and the appearance of Dr Nansen, of Greenland fame, naturally aroused a considerable amount of enthusiasm. The next meeting of the Association will take place in another great centre of human labour—namely, Leeds, and the year after, the Association will find its home at Cardiff.

If we are to believe the sanguine statements of a certain military writer in one of the French journals, the explosive called Melinite must far surpass all previous compounds which have been invented by man for the destruction of his fellows. Melinite, he tells us, is composed of melted picric acid; but its exact composition is a secret, which the Italian and German spies have in vain endeavoured to find out. The explosive has, since its invention some years back, been so perfected that it is absolutely safe. Only one accident from its use has occurred within the past three years, while during the same period other explosives have been responsible for a hundred terrible catastrophes. Melinite can be used for charging shells for field-artillery as well as for forts and siege-guns; and its behaviour upon impact is so terrible that the writer is constrained to ask: What will become of a fortification in face of this redoubtable agent? Some answer the question with a confession that such structures are doomed; others recommend the use of armoured circular forts, from the curved surface of which the deadly messengers will glance and do little harm.

Overhead wires and their dangers are a subject which regularly crops up in this country whenever a snowstorm of exceptional severity has laid low our telegraph lines. But the danger becomes of a far more serious character when such wires are charged with the powerful currents necessary for electric lighting. During a gale in an American town lately, several such wires were blown down, with the result that a number of men and horses were knocked over by electric shocks. Many of these unfortunates were insensible for a long time, and in some cases they have remained in a precarious state.

Her Majesty's ship *Sultan* is now lying in dock at Malta, and is undergoing a patching process,

so that she may be safely towed to England for more permanent repairs. It will be remembered that this vessel struck on a sunken rock in Comino Channel many months ago, and received such injuries that she subsequently sank in deep water. Her loss formed the subject of a long inquiry, and she was regarded as irrecoverable. But a firm of Italian engineers were more sanguine regarding the wrecked vessel than were their English confrères, and they made our government an offer to raise the vessel for a sum of fifty thousand pounds, which would represent about one-fifth of her original cost. By the exercise of wondrous patience and skill, they have been able to fulfil their contract, and have made, it is said, a profit of forty thousand pounds on the transaction. No one will feel inclined to grudge them this reward, which has been thoroughly well earned. But it would seem that a fresh inquiry is necessary with a view to find out why the work of recovery was left to foreigners.

In view of the many conflagrations which have occurred from lightning-struck oil-tanks in the petroleum regions of America, a new system of lightning-rods has been devised by Mr Charles F. Hill. This consists of several upright rods surrounding the tank to be protected, and supporting over the tank itself a roof of iron network. The poles themselves are crowned with the usual points; but a novel feature about them is that they are made of galvanised gas-pipe, and hollow from top to bottom. One object for this form of construction is, that water, from rain or dew, gathered in cups near their summits may be drained off to the earth below, so that a wet-earth contact is always secured. All who have studied the conditions under which a building can be best protected from lightning will at once recognise the importance of this provision.

A curious invention has lately been perfected by Professor Elihu Thompson. It consists of an electrical welding apparatus which can be moved along a railway or tram-line so as to weld the junctions of the rails wherever it may be desirable. To provide for expansion and contraction, a break would be left at every hundred feet. It is difficult to see the object of this joining-up of the rails, especially when we remember that when a rail comes fresh from the rolling-mill it is three times as long as is considered desirable, and is then and there cut into lengths. If there were any good end to be served by using the rail in its original length, surely it would not be cut into shorter pieces. To join these together again when the rail is placed in position seems to represent an unnecessary waste of labour.

A German consular Report has lately called attention to the value of banana fibre, which hitherto seems to have remained almost entirely unnoticed as a textile material. This fibre extends the entire length of the plant, and is not interrupted by the presence of lateral branches; it can be separated into threads as fine as silk, or into strings and ropes of great toughness. Indeed, in Central America this fibre, after being roughly dried, but without any further preparation, is used for shoe-strings and for ropes of all kinds. It is said that if the banana plantations of the entire tropical world were utilised as they ought to be, the markets would be flooded with a textile material that would quickly influence the

value and cultivation of such rivals as hemp, flax, cotton, and jute. The question naturally suggests itself: If all these anticipations of the value of banana fibre be true, why were not its many excellences discovered before? Perhaps, as with certain other plants, there is some difficulty in adapting machinery to prepare it for the market.

Some astonishment was a short time ago aroused by the report that a substance had been discovered which was three hundred times sweeter than sugar. This substance, *saccharine*, has since become a marketable commodity; and those who are curious enough to try its sweetening properties can obtain tabloids of it at most chemists' shops. Our French neighbours were quick to recognise it as a rival to beet sugar, and it speedily obtained a bad name which it does not deserve from their initiative. Our medical authorities regard it as a valuable remedy in certain diseases; and it seems to be used in somewhat large quantities in the preparation of fruits and liqueurs—at least we gather that that must be the case from the statement which is published, that in Germany alone so much saccharine has been made as to render five thousand tons of beet sugar superfluous. The sugar manufacturers are naturally anxious that this new coal-tar product should be regarded as a drug, and that its sale should be effected through chemists only. In other countries, the manufacture of saccharine is arousing the attention of the authorities, who possibly see in it a favourable subject for taxation.

An American inventor has proposed a plan for checking evaporation, in the case of fire-pails, which should always in case of emergency be kept full of water. His plan consists in covering the surface of the water with an air-tight sheet of tinfoil, which could readily be broken through by the hand when required. The suggestion is a good one in cases where pails are in use.

We are glad to hear that the Dairy School which was founded some time back at Kilmar-nock, Ayrshire, and which represents one of the most important training-schools of the kind in the kingdom, is in a flourishing condition and is doing excellent work. It has been aided by a government grant, but still more by the generosity of Lady Ossington, who has placed the Holmes Farm at the disposal of its promoters. Here all the duties of a dairymaid are taught in a systematic way, so that the scheme may be looked upon as a successful attempt to develop female technical knowledge. The instruction in cheese-making at this school has had the direct effect of so improving the quality of cheese made in the district that the price of that commodity has risen from five to fifteen shillings per hundredweight. But it is clear that this improvement will not be of a merely local character, for the pupils, who average thirty in number, are drawn from all parts, and from such distant countries as Sweden, Africa, and Australia. The fees are moderate, and the School is supported by influential names.

The electric light is gradually pushing its way to the front, and we are inclined to believe in its advance, because its progress is so slow that it is the more likely to be sure. Ten years ago it was different, for then the introduction

of a form of electric lamp which has since turned out to be full of objections, caused the gas shares to run down in a few days to about half their previous value. It is improbable that this can ever occur again, for the public are now far better educated in matters electrical. We have always been of opinion that the gas companies have been wrongly advised in posing as rivals to the new light. It would have been a far wiser policy to become agents for it, for they already possess extensive powers, and have at hand all the machinery for dealing direct with the public. This union of gas and electrical interests has already been found to work well in America, and could not fail to succeed in this country. We are interested to see that the *Gas and Water Review* is persistently advocating this policy on the part of gas companies, and has adopted the sub-title, *Journal of Electric Lighting*, as a kind of guarantee of good faith in the matter.

An account has been published of a newly invented mask for the use of firemen, which contains a filter of porous material through which the wearer can breathe air that is supplied to him through a pipe which opens near the floor. A great many protective devices of this kind have been devised from time to time; but it is as well to remember that in cases of emergency there is nothing very much better than a wet blanket. This acts both as a defence against the flames and a filter for the smoke.

An extraordinary case of parental care is recorded by a correspondent of the *American Field*. He tells of having discovered in the corner of a park a quail's nest, from which the old bird would always fly away upon his approach, this bird being invariably the male. There were in the nest twelve eggs, and in due time they were hatched. The female bird was never seen either by the narrator of the story or by any of his men, who were on the spot every day; so that the presumption is that the female was killed soon after the eggs were laid, and that her mate thenceforward took charge of the nest and hatched out the young ones.

A curious method of cutting stone blocks has been perfected by M. Gay of Marseilles. It consists in the employment of an endless wire-cord, which is put in motion by a steam-engine, and which is fed with water and sharp sand. The cord is made up of three steel wires twisted to a certain pitch, and is not quite a quarter of an inch in diameter. It is evident that it can be carried to the stone blocks, and that several can be cut at the same time, provided only that the metal has time to cool between its work on two different stones. As the work goes on, there is a twist upon the cord which causes it to be worn down equally on every side until it gives way from sheer wear and tear. But this does not occur in a cord one hundred and fifty yards long until nearly five hundred square feet of surface have been cut through. The invention is not actually new, for it was awarded a prize at the Brussels Exhibition last year; but it has been much improved in various details.

In the *Journal of the Scottish Meteorological Society* there appears a most interesting paper by Mr Angus Rankin, entitled 'St Elmo's Fire on Ben Nevis,' from which it appears that this

phenomenon is occasionally seen on the mountain. In fact, fifteen appearances had been recorded up to the summer of last year. All these were nocturnal visitations; but probably only because the light given by the so-called fire is far too feeble to be observed during the hours of daylight. The display takes the form of jets of light on the summit of all objects which stand at any height above the general level of the roof of the observatory; and in exceptionally fine displays the tops of the objects are ablaze with the phenomenon, which then glows and hisses in tongues of blue and white, sometimes more than six inches in length. The observer, too, is affected if he stands on the roof of the building, for his hair, hat, and pencil are then all aglow; and if he raises his stick in the air, it is crowned with a long flame. The weather which precedes and follows these displays has marked characteristics, which are not peculiar to Ben Nevis, but affect the whole of Western Europe. We learn that the phenomenon has actually been photographed, St Elmo's fire appearing in the picture as three small tufts of white at the top of one of the chimneys connected with the observatory buildings.

The Employers' Time Recorder is an instrument which has been recently invented, and one which will be found valuable in all places of business where a large number of hands are engaged. It consists of a lever clock, above the dial of which are half-circles engraved with two rows of numerals, upon which are movable pointers. The object of the contrivance is to register every workman's number, the hour at which he arrives and that at which he leaves, in plain printed characters on a slip of paper, which can subsequently be transferred to the wages-book. The co-operation of the men themselves is necessary in this work, for they have to set the pointers at the hour of arrival or departure, and press a lever which makes the printed record; but in the majority of cases they will be only too glad to adopt a system so certain and so free from all cause for dispute. The working of the instrument occupies so little time that two hundred hands can be passed in ten minutes. The clock requires to be wound up once a week, and an inked roller attached to the machine requires occasional attention. The apparatus is constructed by Messrs Lincoln & Co. of Glasgow.

The old adage, which deals with the terrible uncertainty that must prevail 'when doctors disagree,' takes it for granted that all must go well when those learned gentlemen are of but one opinion. But sometimes even doctors are wrong when they are quite unanimous in their vote; witness a statement recently published by the *Belgian News* regarding the dangers of railway travelling. According to this authority, a document has been found in the archives of one of the Belgian railways which is a protest signed by nearly two thousand doctors pointing out the evils of what was at the time a new mode of locomotion. This wonderful document states that 'locomotion by means of any kind of steam-engine should be prohibited,' on the strange ground that rapid change of place 'cannot fail to produce among travellers the mental malady called *delirium furiosum*. But even if travellers consent to run such a risk, the State

ought to protect the spectators from catching the same disorder,' the plan recommended for accomplishing this end being the erection of a paling ten feet high on each side of the railway.

Various processes of sewage purification are in operation or are being proposed; but in every one of them the treatment takes place at the outfall station, thus allowing, unchecked, the formation of what are known as sewer gases on the route along which the sewage flows. Now, however, a method is proposed by Mr E. H. Reeves by which the sewage is, as it were, intercepted as it passes from the house-drains and at once dealt with. Mr Reeves deodorises the sewage as it is run into the sewers from the houses by placing in the sewer man-holes in the streets a small earthenware apparatus, containing in combination strong sulphuric acid and a solution of manganate of soda, which are automatically mixed, and give off sulphurous acid gas and nascent oxygen. Sulphurous acid gas completely destroys putrefactive and contagious organisms; while oxygen, as is well known, is a perfect deodoriser. The solution formed by the combination of the two chemicals overflows into the sewer from the chamber in which they are admixed, and deodorises the sewage on its way to the precipitating tanks. At the same time, whatever gases evolved from the sewage may escape to the outer atmosphere must pass through the chamber in which the chemical gases are generated, and are thus rendered innocuous. Mr Reeves' apparatus is in operation on a small scale at Putney, London; but his method has been extensively and successfully applied for some time at Frome, Somerset.

THE ORDEAL BY CHEWING RICE.

PROBABLY many people have heard of the Indian method of discovering a thief by the ordeal of chewing dried rice. We once saw it tried, and tried with success. It happened more than forty years ago; but as the custom of employing this ordeal has almost disappeared with the advance of civilisation and education in British India, we may be allowed to tell what we remember of it.

Four of us were living together in Calcutta, 'chumming,' as it is called out there. We were young men under twenty-five years of age, recently arrived from England, with fair earnings or salaries, and good prospects in our several professions. We lived in a fine three-storied house, in a large compound or garden, in the fashionable quarter of Calcutta. Amongst us we had a large retinue of servants—altogether about ten men apiece; so that the whole domestic establishment numbered some fifty persons.

One day there was an alarm that my friend George Christian's gold watch was missing. Search for it was made in vain; and we reluctantly arrived at the conclusion that it had been stolen. We held a domestic court of inquiry with the aid of the *moonshers* or native tutors who used to come to teach us the languages; but it was difficult to fix even a suspicion on any one. From the arrangement of our rooms in the house it seemed probable that one of Christian's own servants must have been the thief. But he indignantly repudiated this idea. He said that his servants were the best in the house, and would

never have robbed him, as he was so kind and liberal to them. We may observe that all of us were very confident of the integrity of our own private servants, as is the custom with most young men in India, until they have gained experience. We were almost jealous of one another as to which kept the best servants. We arrayed them in smart liveries, with silver badges in their turbans, and coloured waist-belts. My friend Christian had one remarkably good-looking *khidmudgar*, or table-servant, named Abdul, whom he considered the show-servant of our establishment, and he valued him accordingly.

As our domestic court of inquiry failed to detect the thief or to recover the property, one of our moonshees suggested that we should apply to the Calcutta police for the services of the native official who was then retained in the employ of government for conducting the process of detecting thieves by the ordeal of rice-chewing. It must be remembered that the Calcutta police itself was at the lowest stage of efficiency. It was feebly officered and badly manned. For the detection of thieves, especially in cases like ours, where domestics were suspected, they trusted to the services of a professor of magic.

The Pundit—as we shall call the professor—with two or three policemen escorting him, arrived at our house about eleven o'clock one morning. All our servants had been warned of the impending ordeal, and the lodge-keeper had been ordered to allow no one to go outside the gates. The Pundit was a tall and stout man, arrayed in muslin, and evidently possessed with a great idea of his own importance. According to his request, the servants were all seated in two rows on the ground in one of the long verandas of our house, and we took up our position so as to be able to superintend the operation. The Pundit's attendants then produced some pieces of green plantain-leaf, and a small portion was placed in each man's hands, to serve as a plate, on to which he was to eject the dried rice after he had successfully chewed it. The Pundit then went round with a bowl full of pounded rice, like flour, and with a wooden spoon poured a quantity of this rice-flour into the open mouth of each servant. The order was given that each man was, within five minutes by the watch, to chew the rice-flour and eject it, in a state of pulp, on to the plantain-leaf before him. Most of the men set to work with a will, though a few were rather frightened at first; but long before the five minutes had elapsed almost every man had got through the process, and held what may be called 'the evidence of his innocence' in his hands. But why are so many eyes turned towards one man, who sits back as if anxious to avoid observation? We also look, and there is Christian's favourite *khidmudgar*, Abdul, with his face almost convulsed, and trying in vain to get the rice-flour out of his mouth. His lips are dry, and his glands refuse to produce the saliva which is needed to moisten the rice-flour. At last the Pundit's eyes glare at him, and pointing at him with his long bony finger, he says solemnly: 'There is the thief.' The victim quails and growls on the floor before him; his handsome face becomes livid with terror; and at last he faintly appeals to his master for forgiveness, and promises that he will restore the

watch. All the other servants are now talking as fast as they can, delighted at their own deliverance, and full of reverence and dread for the Pundit. The convicted thief slowly rises, and requesting his master to follow him, goes to the well in the garden, and produces the gold watch from under a loose brick.

The Pundit and his men were duly presented with a handsome reward, and the members of our household returned to their ordinary duties. Not quite so perhaps; for although the thief was not given up to the police, to be tried and punished by a magistrate, he was brought before the domestic tribunal, at which his master was president, and sentenced to receive twenty strokes from a rattan. The twenty strokes were presently administered by two of our most stalwart *sycees*. After this, the culprit was readmitted into his master's favour, and became a much better servant than he had been before. Nor did his fellow-servants in the least object. They recognised the fact that he had expiated his guilt by the punishment that he had suffered, and they were not so uncharitable as to deny him a chance of regaining a good character.

A U T U M N.

Brown and bare are the Autumn fields;
Reaped and stacked is the yellow grain;
Hardly a partridge the stubble yields,
So closely shorn is the bristly plain.
Summer is dying 'mid shower and cloud,
Crimson and gold is his royal shroud.

Winter is coming; the leafy woods
Are withering fast in their golden pride;
For the wind is fierce, and the rain in floods
Is sweeping o'er valley and mountain side.
Dead leaves are flying through sun and shade,
A crimson carpet all down the glade.

Mute are the Finches, the Lark, and the Linnet;
Only the Robin sings loud and clear,
A song for the beauty and joy of Summer,
A sweet good-bye to the waning year.
Mead and valley and mountain steep
In misty silence are falling asleep.

But out of their sleep shall they one day waken,
And sparkle anew with pearl and gold,
When the rosy gates of Morn reopen,
And crown with splendour the dusky world.
Though the year die out amid cloud and rain,
Yet golden Summer shall come again.

B. G. JOHNS.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

ROME IN TRANSFORMATION.

No city is going through so rapid and radical a transformation as Rome. The map of the town published only in 1886, at the beginning of 1889 is scarcely serviceable. A great question had to be solved: how to accommodate the Rome whose history goes back into a remote antiquity, a city crowded with relics of the past from that remote period when it was first founded, with the requirements of a modern capital to a new kingdom.

The Rome of the popes went on in a happy-go-lucky fashion, houses, churches, palaces, ruins jumbled together, without a proper thoroughfare from one end of the town to another; and so long as Rome was but the capital of the Papal States and a curiosity-shop, that was well enough; but such a condition of affairs could not exist when it became the centre of political and social and mercantile life to an entire kingdom. Accordingly, Rome is going through, as stated, a rapid and radical change, so rapid that one-half of the space within the old walls, mapped in 1886 as garden and vineyard, is now covered with houses; so radical, that large portions of the town are being absolutely transformed. For instance, the banks of the Tiber were crowded with mean and miserable houses, and the river was only reached at the bridges. One of the main bridges, that of Quattro Capite, connecting the city with Trastevere by the Tiberine island, had as an artery of traffic a wretched lane, in places fifteen and a half feet wide, in one place the roadway narrowing even to eleven and a half feet.

The Tiber has been known to rise from thirty to thirty-five feet, as was the case in the inundation of 1871. Its average width is sixty-five yards, and its depth twenty feet. The houses on both sides of the river have been pulled down; magnificent embankments of masonry are being constructed, enclosing and slightly widening the stream—a work worthy of the ancient Romans; and on the top a broad esplanade is being formed, so that eventually it will be possible to walk along

the river on both sides of the Tiber, as on the Thames Embankment. The old bridge of Sixtus IV., constructed in 1474, has been removed, and a new bridge erected in its place, sixty-three feet wide. The view from this bridge and that of Quattro Capi have long been famous. It is, however, doubtful how long it will be remarkable, for enormous houses seven stories high are being erected along the new embankment, which will shut out the view not only of St Peter's, but also of the Janiculum and of Monte Mario. What will be a gain in one way will be a loss in another. If the municipality and the building Companies could be brought to consider how ruinous to the effect it will be to shut out these objects from view, and to moderate the height of the new rows of houses, the alteration would be a real advantage.

Archæologists are animadverting angrily on the destruction of certain ruins that have been brought to light by the alterations; but it may well be asked, whether it was possible under the circumstances to save them. Rome is not a healthy city. The narrow lanes and foul habitations were nesting-places for fever-germs, and what was essential, if the city was to become a capital and largely to increase, was, that great passages should be driven through these dens of poison, to let the fresh air in. The Via Nazionale is such a ventilator. It is not completed, but it is being carried daily, as the work of demolition proceeds, deeper into these slums, and will finally reach the river.

The Corso is at best narrow, and in time will no doubt be widened, but it ends at the great mass of brick buildings, the Venetian Palace. At the present time, houses are being demolished beside the Capitol, where now runs the Via Marforio, so that the Corso may be carried on, and skirting the Forum and the Basilica of Constantine, strike the Colosseum; then the winds will blow through Rome.

Every one who has been in Rome knows the slums that lie between the Forum and Santa Maria Maggiore. Here also demolition is going on; and a thoroughfare is being made to let air

in and traffic pass, a thoroughfare which will eventually open out of the continued Corso. In so doing, extensive remains of the Temple of Venus Genetrix, hitherto concealed behind houses, have been disclosed.

But there is one sacrifice being made which might well have been omitted. The beautiful villa gardens, with their ilexes and their stone pines and their cypresses, are being ruthlessly destroyed. The railway station and goods department occupy the site of what was one of the loveliest gardens in the world. The glorious gardens of the Ludovisi Palace are gone, occupied by hideous blocks of modern houses. On the Via Salaria these glorious gardens are in process of destruction, the century-old trees being hacked down. All the gardens, vineyards, that extended from the church of Santa Maria Maggiore to the Lateran are built over.

The presence of parks in a town is necessary to its salubrity; they are open spaces in which the fresh air blows; consequently, it is a mistake to wreck these gardens from a sanitary point of view, apart from the loss to the eye, and the destruction of what constituted one of the main charms of old papal Rome. The new Government, or rather the municipality, seem to entertain a hatred of trees: wherever they can, they hew them down, not only with detriment to the landscape, but with injury to health, for every tree and shrub and flower assists in the purification of the atmosphere. In the same way have the municipal authorities stripped the ruins of the creepers and other plants that veiled their raggedness. Mr Hare, in his *Walks in Rome*, says: 'The whole aspect of the city is changed, and the picturesqueness of old days must now be sought in such obscure corners as have escaped the hands of the spoiler. The glorious gardens of the Villa Negroni and Villa Ludovisi have been annihilated; ancient convents have been levelled with the ground or turned into barracks; historic churches have been yellow-washed or modernised; the pagan ruins have been denuded of all that gave them picturesqueness or beauty. The Palace of the Cæsars is stripped of all the flowers and shrubs which formerly adorned it. The baths of Caracalla, which, till 1870, were one of the most beautiful spots in the world, are now scarcely more attractive than the ruins of a London warehouse. Many of the most interesting temples have been dwarfed by the vulgar and tallest of modern buildings. Even the Colosseum has been rendered a centre for fever by aimless excavations, and has been deprived not only of its shrines, but of its marvellous flora, though in dragging out the roots of its shrubs, more of the building was destroyed than would have fallen naturally in five centuries.' Indeed, as they now appear, the ruins more resemble masses of old mite-eaten Stilton cheese than anything else, and are wholly void of charm. A vast amount of irreparable mischief to Christian antiquities is being wrought outside the Porta Pia and Porta Salaria, where ranges of model-lodging-house style of buildings are being run up to accommodate the lower classes, and their foundations are being laid in the early Christian catacombs, which are choked up with rubbish, and ruthlessly broken through

to form basements and cellars for these vile erections.

Another work that is being carried on, and which is greatly altering the appearance of the city, is the levelling the historic hills and filling in the valleys between, so as to form comparatively level runs for the streets and for the accommodation of trams. It is not possible to altogether abolish the hills, or the municipal council would do it; as, however, the seven hills are too great, and defy that, the excavators take slices out of their sides, or take off their heads and make embankments across the valleys, and fill up wherever filling-up can be done, so as to form a series of *piani* or levels, along which the carriages and buses can run without any great amount of collar-work for the horses.

The Anio makes a great loop about the Mons Sacer. 'This spot,' as Arnold says, in his *History of Rome*, 'on which the great deliverance had been achieved, became to the Romans what Runnymede was to Englishmen: the top of the hill was left for ever unenclosed and consecrated.' It was to this spot that the plebeians seceded, and where they encamped, B.C. 494, till they had extorted from the patricians the concessions of tribunes who were to represent the interests of the people. Alas! even this Mons Sacer is not sacred to the eyes of the municipal authorities, which is being carted away as building material for the ranges of new houses which are making Rome as modern and hideous as are the new quarters of a thousand cities on the Continent, all equally hideous and uniform in their type.

There is no *pro* without its *con*. The capital of Italy must be Rome. That was decided upon, regardless of other considerations than sentiment. Having decided on making it the capital of Italy, it is hard to see what else could be done. A vast increase of accommodation was necessary, and means of passage from one part of the city to another must be found; it was impossible for the traffic now trebled to pass through the old arteries.

There was much against making Rome a capital. It is unhealthy except during the winter. It is the curiosity-shop of Europe. It was full from end to end of historic associations. It could be enlarged only on one side. Florence, on the other hand, is healthy; there was little to spoil there in order to acquire room; and the city could be expanded indefinitely on all sides.

But, as the determination was come to that Rome was to be the capital, there was no choice in the matter—the place must be fitted to the demands of the population crowding into it, and to the exigencies of a capital city where is the court and centre of government.

The artist complains that the picturesqueness of Rome is being destroyed; but we are much inclined to dispute the picturesqueness of the dirty houses and narrow streets that are being swept away; and the antiquary must remember that if some few things have to go, a great deal that was hidden has been revealed, and discoveries made which are a real gain to archaeological science, and which would not have been made but for the remodelling of Rome under the new régime.

Then again, and lastly, is not the health, the happiness of the present and the future, better

than a little questionable picturesqueness and a few crumbling walls? The increase in the population of Rome is so rapid that the crowding, and with the crowding, disease and death would be rampant, were it not that the municipality had faced the problem and resolved on a re-planning of the city. The old emperors brought pure water into Rome, and Rome now enjoys an abundance of fresh and wholesome water. But what Rome does not enjoy is fresh and wholesome air, and that is what the municipality are introducing as fast as they possibly can. By all means let the relics of the past be preserved, but not at the expense of the present.

A DEAD RECKONING.

By T. W. SPEIGHT.

CHAPTER X.

IN less than a week after her interview with Picot, Mrs Brooke, her husband, and Miss Primby were settled in their new home. The rooms recommended by the Frenchman had proved more to Clara's liking than any she had seen elsewhere, and she at once engaged them. The furniture and fittings were to a great extent after the cheap and tawdry style so much affected by the inferior class of French lodging-house keepers; but as the whole place was pervaded by an air of cleanliness, such little *désagrémens* as existed in other respects Clara was prepared to overlook.

No. 5 Pymn's Buildings was one of a row of half-a-dozen houses similar to itself in size and outward aspect, situated in a quiet court abutting on a main thoroughfare in the busy and populous district of Soho. All the houses in Pymn's Buildings accommodated a more or less numerous tribe of lodgers, the lower floors being generally arranged in suites of rooms for the convenience of families, while the top floors were usually divided into separate sleeping apartments. And it was in this place and amid such sordid surroundings that the whilom owner of Beechley Towers hoped to find for a little time a secure shelter from the hue and cry of the ten thousand hounds of policedom, each and all of whom were doing their utmost to run him to earth. His idea had been to bury himself in the heart of some densely populated district where one man is but as a grain of sand among ten thousand others, and in so far it may be surmised that he had been successful.

When Mrs Brooke quitted Beechley Towers secretly and by night to join her husband in London, Margery, faithful Margery, was the only one who was made aware of her departure. The girl pleaded so hard to be allowed to accompany her, that at last Clara was fain to make her a promise that she would send for her as soon as she was settled in her new home. Thus it fell out that Margery was now here, and her mistress found the value of her services in a score different ways. For instance, Margery did all the marketing, and did it for little more than half what it had cost before her arrival. Poor simple-minded Clara, who believed everybody to be as honest as herself, had been imposed upon at every turn; but the shopman or peripatetic vendor who succeeded in 'besting' Margery, as

she termed it, must have been very wide-awake indeed. The girl would haggle for half an hour over a penny, and her powers of vituperation always rose to the level of the occasion.

What was Mrs Brooke's surprise about the third day after her arrival at Pymn's Buildings, as she was on her way down-stairs, to encounter M. Picot on his way up! Then it came out that the mountebank rented a room at the top of the house which he looked upon as a permanent home, and occupied as such when his avocations did not take him elsewhere. Had Mrs Brooke been aware of this fact at the time, she might perhaps have hesitated before deciding to take the rooms. And yet, somehow, she had an instinctive feeling of trust in the mountebank—the same sort of trust, although in a lesser degree, that she had in Margery; and after the first tremor of alarm which shot through her when she encountered him on the staircase, she never felt a moment's doubt that her secret, or as much of it as he might know or suspect, was safe in his keeping. It became, of course, necessary to explain to him that it was she and her husband, and not any one else, whose fortunes had changed so woefully. But Picot was one of the most incurious of mortals outside the range of his own affairs. He only remembered Clara as 'la belle madame' who had kissed his boy and spoken kindly to him and had laden him with gifts, and about whom Henri often spoke when his father and he were alone. He had never thought of asking any one what her name was; and even now, when he understood from Clara how terribly the circumstances of herself and her husband were changed, he expressed neither curiosity nor surprise in the matter. He was *vraiment désolé*—he was heart-broken to think that such should be the case; but that was all. He did indeed, a little later, ask the landlord the name of his new lodgers; and when he was told that they were known as Mr and Mrs Stewart, he repeated the name to himself two or three times over, so as to impress it on his memory, and then went contentedly on his way.

The furnished lodgings rented by Mr and Mrs 'Stewart' comprised three rooms on the first floor and two on the second. As it chanced, the rooms on the ground-floor were at present untenanted. The sitting-room had two windows and was a tolerably sized apartment. In it, about eight o'clock on a certain autumn evening, were seated Miss Primby and Margery. The former, as usual, was engaged on some kind of delicate embroidery; while the latter was trying her hand at a little plain sewing, the result being that on an average she pricked her finger once every three or four minutes. But, indeed, the girl was somewhat nervous this evening, or what she herself would have termed 'in a pucker.' She had had the ill-fortune to 'break a cup while washing up the tea-things.

'O mum, do you think Mrs Stewart will let me stay when I tell her? She won't turn me away, will she?'

'Why, of course not, Margery. It was an accident; it cannot be helped.'

'Oh, thank you for saying that, mum. Sometimes my fingers seem as if they were all thumbs, and I let everything drop. But I wants no wages, mum, and I ain't a big eater—leastways,

I think not; and I'll eat less than ever now, so as to help to pay for the cup. A crust of bread and 'drippin', a few cold taters, and the teapot after everybody else has done with it—that'll do me.'

'You must not talk like that, Margery; your mistress would not like it.'

'Oh, but you don't know how sorry I am, mum. Mariar—her on the boat—always used to say as I was a great awk'ard lout of a girl; and she was about right there.'

The two went on with their work for a little while in silence, and then Margery said: 'You'll excuse me, mum, for saying so, but I've often wondered why such a nice lady as you never got married.'

The spinster could not help bridding a little. 'Married! How absurd of you, Margery,' she exclaimed. 'From what I have seen of married life, I'm sure I am far better off as I am.' Then, as if by way of afterthought: 'Not but what I have had several most eligible offers at various times.'

'Lor! mum, didn't it make you feel all-overish-like when they went flop on their knees and asked you to marry 'em?'

'Gentlemen don't often go on their knees nowadays. Still, I have had them do that to me more than once. I remember that when Mr Tubbins, the eminent brewer, did so, he was so very stout that he could not get up again without assistance.'

'My! I'd have stuck a pin into him; that would have made him jump,' cried the girl with her strange laugh.

At this juncture the door opened and Mrs Brooke came in. She was plainly dressed in black, and was closely veiled. Since Margery's arrival she rarely ventured out of doors till dusk, and then only when she wanted to do a little shopping such as the girl could not do for her. Any one who had not seen her since that April evening when M. Karovsky's ill-omened shadow first darkened the terrace at Beechley Towers, might have been excused for failing to recognise her again. It was not merely that she looked older by more years than the months which had elapsed since that day—anguish, anxiety, and the dread which never ceased to haunt her of what the next hour might bring forth, had marked their cruel lines on her features in a way that Time's gentle if inexorable graver never does when left to labour alone. The clear dancing light had died out of her eyes long ago; they looked larger and shone with a deeper and more intense lustre than in the days gone by; but a sudden knock at the door, an unusual footfall on the stairs, or the voices of strange men talking in the court below, would fill them on a sudden with a sort of startled terror, just as the eyes of a deer may fill when first it hears the baying of the far-away hounds.

She took off her bonnet with an air of weariness and sat down. 'Has not Gerald returned yet?' she said to her aunt. 'What can have become of him?'

'The evening is so fine that he has probably gone for a longer walk than ordinary.'

'It makes me wretched when he stays out longer than usual. And yet, poor fellow! what a life is his. To be shut up in one miserable room from

morning till night; never to venture out till after dark, and then only with the haunting dread that he may be recognised and arrested at any moment! How will it all end?' She sighed and went into the other room. Presently she returned, and a few moments later a knock at the door made every one start. Margery hastened to open it. Outside stood Picot carrying a bunch of flowers. 'Bon soir, madame,' he said, addressing himself to Clara with a low bow, and then favouring Miss Primby with another.

'Bon soir, Monsieur Picot. Entrez, s'il vous plait.'

'Merci, madame,' he answered as he advanced into the room. 'I have here a petit bouquet—a few flowers—which Henri has sent for madame, if she will have the bonté to accept them.'

'I shall be charmed to do so,' answered Clara as she took the flowers. 'How fresh and sweet they smell! I am much obliged to Henri, and to you also, monsieur.'—The mountebank made another low sweeping bow.—'I hope that Henri is quite well?'

'Parfaitement bien, madame.'

'The first time he has a holiday, he must come and take tea with me; I will not forget to have a nice cake for the occasion.'

'He will be enchanté, madame.—Ah! if madame could see him on the trapeze—could but see him jump from one bar to another—it is splendid, magnifique!'

'I think I would rather not see Henri go through any of his performances, monsieur.'

'Mais, madame!' with an expressive shrug; 'there is no danger, nothings to be afraid of. Oh, the grand artiste that Henri will be one day! He is twice so clever as I was at his age. He will be what you call in England great man—big fellow.'

'I am very glad to hear it. Meanwhile, you will not forget that he is to come some afternoon and take tea with me.'

'Ah, madame, he talk about you every day.—But I go now. I hope that monsieur your husband finds himself quite well?'

'Quite well, thank you, monsieur.'

With that the mountebank made his adieus and bowed himself out.

It here becomes needful to explain that just then Henri was engaged at a certain hippodrome as one of a troupe of juvenile acrobats who, under the pseudonym of 'les frères Donati,' and under the tuition of a celebrated 'Professor,' were performing a number of well-nigh incredible feats before crowded and enthusiastic houses.

'Ain't he polite!' said Margery as Picot closed the door. 'But what a pity the poor man talks such a lot of gibberish.'

'What can have become of Gerald?' said Clara for the second time, as she went to the window and drawing aside the curtain peered into the darkness. 'I never knew him to be so late before. I cannot help feeling dreadfully uneasy.' Then turning to Margery, she said: 'Here is a list of things I want you to fetch from the grocer's in Medwin Street. Do you think you can find your way in the dark?'

'Why, of course, mum. I never gets lost, I don't.' Half a minute later she ran down-stairs, whistling as she went.

The minutes dragged themselves slowly away,

and Clara was working herself into a fever of apprehension, when a well-known footfall on the stairs caused a cry of gladness to burst from her lips. 'At last!' she exclaimed as she started to her feet and hurried to the door. 'How glad I am that you are safely back,' she added as her husband entered the room. 'You were away so long that I grew quite frightened.'

'The evening was so pleasant, that I extended my walk farther than I intended. I must be a caged bird now for the next four-and-twenty hours. Heigh-ho!'

'Will you not have something to eat?'

'Thanks; nothing at present,' he answered as he proceeded to lay aside his slouched hat, his overcoat, and the muffler which had shrouded the lower part of his face. Then he took up a book and sat down in an easy-chair near the fire.

His wife's eyes brimmed with tears as they rested on him. 'My poor boy!' she said softly to herself. 'This life is killing him. When, oh, when will it end!' She sat down to her needle-work.

Miss Primby was the first to break the silence. 'Do you know, my dear,' she said to her niece, 'that Monsieur Picot puts me greatly in mind of the Count de Bounechose, a French nobleman who once made me an offer of marriage. He used to speak just the same delightful broken English—and then he had such great black eyes, which seemed to pierce right through you, and the loveliest waxed moustaches; so that when he clasped his hands and turned up his eyes till nothing but the whites of them were visible, and murmured "Mon ange," and called me his "beautiful Engleesh mees," can you wonder that my heart used to thrill responsively?'

Clara could not repress a smile. 'I am by no means sure that I should have cared to call that count my uncle.'

'It was a mercy that I sent him about his business. He turned out to be no nobleman at all, but only a hairdresser's assistant whose father had left him a little money. But certainly he had remarkably fine eyes.'

Again there was a brief space of silence. This time it was broken by a knock which sounded all the more startling because no one had heard the faintest sound of footsteps on the stairs. All three started to their feet and looked at each other. Then, at a sign from Clara, Miss Primby crossed to the door and opened it.

Framed by the doorway and shone upon by the lamplight from within, they beheld the black-clothed figure, the statuesque, colourless face and the inscrutable eyes of M. Karovsky.

'Karovsky—you!' cried Gerald as he sprang forward.

'Yes, I—why not?' said the Russian with a smile, as he raised his hat and came forward.—'Ladies, your servant.' Then to Gerald: 'You stare at me, mon ami, as if I had just come back from Hades. But this is scarcely the hand of a revenant, if I may be allowed an opinion in the matter.'

'It seems incredible that you should have found me out in this place,' answered Gerald as the two shook hands.

'Incredible? Peuh! I had need to see you; and I am here.'

'Will you not be seated?'

As Karovsky drew up a chair, Clara made a sign to her aunt, and the two ladies passed out through the folding-doors into the room beyond.

'Pardon,' said the Russian as he glanced around, 'but this place seems scarcely a fit home either for madame or yourself.'

'You know that I am in hiding; you doubtless also know that a large reward is offered for my capture?—The other nodded.—'While such is the case, it is impossible for me to touch a penny of my income. My wife's aunt has lost her property by a bank failure. We are very poor, Karovsky; but there are worse ills in life than poverty.'

'Part of my errand to-night is to tell you that I have instructions to place certain funds at your disposal. You can leave this place to-morrow, if it please you so to do.'

'Thanks, Karovsky; but I cannot accept a penny of the money you offer me.'

'How! Not accept! But this is folly.'

'It may seem so to you; but that does not alter the matter.'

'It is unaccountable,' said the Russian with a lifting of his black eyebrows. 'But why remain in these wretched apartments? Why not go abroad—on the Continent—to America—anywhere? The world is wide, and there are places where you would be far safer than here.'

'I doubt it. One reason why I am here is because I believe this spot—in the heart of one of the most populous quarters of London—to be as safe a hiding-place as any I could find. My other reason is that were I to go abroad, I feel as if I should be throwing away my last faint hope of ever being able to prove my innocence to the world.'

Karovsky stared at him in wide-eyed amazement. 'How! Your!—'

'My innocence of the murder of Baron von Rosenberg.'

'Pardon; I . . . I to comprehend.'

'When we parted last, I told you clearly and emphatically that, let the consequences to myself be whatever they might, mine should not be the hand to strike the fatal blow; but when you left me, you evidently did so in the belief that in a little while I should change my mind, and that of the two alternatives you had placed before me, I should choose the one which you yourself would in all probability have chosen had you been in my place. Time went on, and, within the period you had prescribed, Von Rosenberg was found dead, shot through the heart. Such being the case, it was perhaps a not unnatural conclusion for you to arrive at that it was I, Gerald Brooke, who was the assassin.—But I ask you, Karovsky, to believe in the truth of what I am now going to tell you. I had no more to do with the death of Von Rosenberg than you yourself had.'

'Est-il possible!' exclaimed the Russian in a voice scarcely raised above a whisper. For a few moments he sat staring silently at Gerald; then he went on: 'Not often am I astonished at anything I hear; but you, Gerald Brooke, have astonished me to-night. The evidence against you seemed so conclusive, that I never doubted Von Rosenberg fell by your hand. Yet more than once I said to myself: "What an imbecile

Brooke must have been to leave behind him such a condemnatory piece of evidence as the weapon with which he did the deed!"—But who, then, was the individual who so kindly spared you a necessity so painful?"

'That I know no more than you do.'

'C'est un vrai mystère.'

'From day to day I live in hope that the real criminal will be discovered and brought to justice; but with each day that passes that hope grows fainter within me.'

'I know not what to say.—When I remember the past, and when I look round and think that this is now the home of you and madame'—He spread out his hands with a gesture more expressive than words.

Before more could be said, there came a peculiar knock at the door—three taps in quick succession, followed by a fourth after a longer interval. At the sound, Clara and Miss Primby emerged from the other room.

'That summons is intended for me,' said Karovsky quickly as he rose and opened the door.

Then those inside saw that a man, a stranger, was standing on the landing, who seemed to retire further into the shade the moment the light fell on him. He said something rapidly in a low voice to Karovsky, to which the latter replied in the same language. Then the Russian gave a nod as of dismissal, and closing the door, turned and confronted Gerald with a grave face and distended eyes. 'That man is one of us,' he said. 'When I entered the house, I left him on watch outside. He now comes to tell me that a policeman in plain clothes is on guard outside the court, and that another is stationed inside, so that no one can pass in or out without being observed. He also tells me that there are two more constables in uniform patrolling the street close by; and that from what he can gather, they are waiting the arrival of some one, probably a superior officer. Is it possible, Brooke, that you can be the quarry on which they intend presently to swoop?'

'There can be little doubt of it,' answered Gerald, who had risen to his feet while Karovsky was speaking. He had turned very pale; but his lips were firm-set, and the expression which shone out of his eyes was something far removed from craven fear.

Clara stood with one hand resting on the table, her frame trembling slightly. Was the blow she had dreaded so long about to fall at last?

Miss Primby sat down with a gasp.

'Well, let them come,' went on Gerald after a moment's pause. 'It will be better so. I am tired of this life of hide-and-seek. Why not end it here and now?'

'No, no!' cried his wife. 'Even at this, the eleventh hour, there must surely be some way of escape.'

'Even if I were eager to escape, which I am not, I know of none.'

'Madame is right,' said the Russian in his impressive tones. 'There is still one way of escape.'

'And that is?'—said Gerald interrogatively.

But before Karovsky could reply, Margery, breathless and dishevelled, burst into the room. 'O Muster Geril!—O mum,' she exclaimed, 'the polis is in the court—four or five of 'em, and I

believe they're coming here. But I shut and bolted the door at the bottom of the stairs; and it'll take 'em some time to break that down,' added the girl with a chuckle.

Picot, who was on his way down-stairs as Margery rushed up, had overheard her words, and he could now be seen dimly outlined on the landing, his eyes piercing the obscurity like two points of flame; but for the moment no one observed him.

THE TRINITY PILOTS.

BY R. H. MC CARTHY.

VERY many of those who are familiar with the somewhat imposing stone building near the head of Tower Hill, known as Trinity House, have but a hazy idea of the use to which the structure is put, or of the functions of the body whose habitation it is. After moving from Deptford to Ratcliffe Highway, thence to Stepney, and afterwards to Water Lane, in the City, where it was twice burnt out, the corporation, thus described in a charter granted by Henry VIII., in 1798 erected the present building: 'The Masters, Wardens, and Assistants of the Guild, Fraternity, or Brotherhood of the Most Glorious and Undivided Trinity, and of St Clement in the parish of Deptford Strond, in the county of Kent.' The first Master was Sir Thomas Spert, commander of the famous *Great Harry*, which carried Henry and his splendid retinue as far as Calais on their way to the Field of the Cloth of Gold. This charter permitted the mariners of England to form a guild, which might include women, and empowered it to make laws for shipping, and to punish offenders against such laws. Subsequent monarchs widened the sphere of the society. In the eighth year of Elizabeth, for instance, there was passed an Act, which, after describing the corporation as 'a company of the chiefest and most expert masters and governors of ships, charged with the conduction of the Queen's Majesty's navy,' and bound to see to the supply of ships and men for Her Majesty's service, laments the loss of life caused by the destruction of marks along the coast, and authorises the Trinity Brethren (as the members were and are called) to preserve and erect beacons for the guidance of ships.

Further extensions were made by James II., the most important being with reference to pilotage. The king, having ascertained that serious loss of life and property arose from the incompetency of pilots, forbade the latter to take charge of ships in the Thames or Medway, unless provided with licenses from the Trinity House, confirmed by the Lord High Admiral; and a deduction from the earnings of pilots holding licenses was sanctioned, with a view to forming a pension fund. Acts of the 48th and 52d of George III. directed the corporation to license cutters to cruise with pilots off the coast, and to appoint sub-commissioners where there was already no pilotage authority. Side by side with the growth of its pilotage duties, the powers of the Fraternity with regard to beacons increased; and ultimately, by purchase from the Crown and from private owners, it obtained the sole right to levy duties upon shipping for the maintenance of lights on

the coast of England. But this, as well as other branches of the work of the Guild, is outside the scope of our paper.

In 1853 the power of the corporation had reached its zenith. It managed a large income of some three hundred thousand pounds a year with a minimum of inconvenience to the community, and to the great advantage of the charities attached to the society. Committees of the House of Commons had in 1822, 1834, and 1845 investigated its business, and on each occasion the brethren emerged from the ordeal with credit. Still, it was against the spirit of the age that a self-elected, irresponsible body should tax shipping, even for charitable purposes; and by the Merchant Shipping Act of 1854 the corporation was shorn of much of its power. From bequests and other sources, considerable property had been derived, and was employed in supporting almshouses and out-pensioners. This was left untouched; but the brethren were made responsible to the Board of Trade for everything connected with light dues and pilotage, and the disposal of the revenue thus obtained vested in that body. But though subject to this control, the functions of the Trinity House remain highly important. Nautical men are flattered when invited to become 'elder' or 'younger' brethren, high personages have been glad to accept honorary membership, and a royal Duke is proud of his position as Master.

The Act of Parliament just referred to amalgamated with the Trinity House of Deptford Strond a similar institution at the Cinque Ports, over which the Lord Warden presided; but three other Houses remained, as venerable if not so powerful as that on Tower Hill. At Hull, Newcastle, and Leith, Shippers' Guilds existed at a very early date, which were virtually friendly societies, and this character they all preserved when the possession of royal charters increased their power and wealth and made them more useful to trade. The Trinity Houses of Hull and Leith were legally recognised in the latter half of the fourteenth century, and the present charter of the Hull Guild is dated 1537. The Leith Trinity House licenses pilots for the Firth of Forth, the North Sea, and for the coast as far south as Orford Ness, in Suffolk. That of Newcastle up to 1864 held sway over the pilotage, lighting, and buoyage of the Tyne, and of the coast from Holy Island to Whitby, eight hundred pilots owning its authority. But Hartlepool and Sunderland obtained permission to manage their own affairs, and the Tyne has been placed under elective bodies, so that hardly anything remains to the Trinity House. The Hull Guild retains the management of the Humber pilotage and of the streams flowing into it; and besides other powers, it has that of licensing pilots for the Baltic, the North Sea, and for the coast between Whitby and Orford Ness, where the authority of the Deptford Strond House commences.

Omitting the legal boundaries and divisions, the latter fraternity practically has charge of the pilotage between Orford Ness, southward and westward, to the Bristol Channel, and of the harbours between. Though the importance of its lighthouse duties has overshadowed its position as a pilotage authority, it will be seen that with this as with the other corporations, the pro-

vision of pilots was one of its main, perhaps its primary function. Indeed, that was so before any charter was obtained; for from an early period the Fraternity maintained a pilotage station for outward-bound vessels at Deptford and at Leigh, near Southend, for ships entering the Thames. It was also in their capacity of master-pilots that in 1797 some of the Elder Brethren of Deptford Strond personally, by night, removed the buoys in the Nore, and thereby did much to quell the sailors' mutiny; and in the same capacity they took on themselves the defence of the Thames in 1803. As pilots, too, they escorted the Queen on her voyage to Scotland with Prince Albert in 1842; and on the occasion of naval reviews their yacht is privileged to precede the royal procession. There are numberless other pilotage authorities in the United Kingdom; but they are mere mushrooms, things of yesterday, whose rules are usually copied from those of the Trinity Houses, especially that of Deptford Strond. It may be of interest to glance at that system, the result as it is of many centuries of experience.

In early times the pilot was simply the steersman, and the references to that official in classical literature must be so understood. The word is of Dutch origin, and meant a person who conducted a vessel with the assistance of a sounding-line; but the legal definition given in the Merchant Shipping Act of 1854 is, 'any person not belonging to a ship who has charge of it.' The importance of such aid to shipmasters has been recognised from the infancy of commerce; and the maritime laws known as the *Ordonnances de Wisbuy*, enacted in the twelfth century, and adopted by most European countries, made the employment of local pilots compulsory. The present state of our law is that all vessels above sixty tons engaged in the foreign trade, and all home-trade ships—that is, those plying from one British port to another, or to any part of Europe north of Brest—carrying passengers, are obliged to take a legally qualified pilot. Obviously, then, it becomes the duty of the legislature to provide pilots, a task which the Trinity House performs, directly as regards the district between Orford Ness and Dungeness, and through sub-commissioners over the remainder of its jurisdiction. By itself or its deputies, the Deptford Strond corporation rules nearly nine hundred pilots.

Any seaman is eligible for a pilot's license; but those who have served an apprenticeship to the calling get a preference, and as there is usually an ample supply of ex-apprentices, this is practically the only road to the position. The youth, who must be above fourteen when indentured, serves seven years, during which he may be employed as a fisherman, a yachtsman, or even on board a trader; but he is expected to occasionally spend a little time on board one of the pilot-cutters belonging to the port for which he seeks a license. Then, on a vacancy occurring, he among others is examined as to his knowledge of local waters, and in seamanship—'the method of staying or wearing a vessel, the complete management of a ship in bad weather and narrow channels, to be able to bring her properly to an anchor, to keep a clear anchor, and to know how to get her under weigh in all situations.' If successful, he pays a fee,

usually two guineas, enters into bond for one hundred pounds as a guarantee against any loss brought about by his neglect, and receiving a license, is appointed to a cutter. The Trinity pilot is also required to pay two guineas a year for the renewal of his license, and to contribute two and a half per cent. on his earnings towards the Pilot Fund. This Fund has a capital of ninety thousand pounds, and out of it infirm members get an allowance varying according to length of service from ten to sixteen pounds per annum. Widows of pilots receive from four to six pounds, and children twenty-four shillings per annum. In the London district these allowances are more liberal. Necessarily, the pilot is under rigid discipline. To keep a public-house, or a shop for the sale of dutiable articles, is forbidden to him, and drunkenness or other misconduct is severely dealt with. Pilots are expected to take care that the quarantine laws are not infringed, and on them local authorities depend to see that their regulations are adhered to by shipmasters.

There is one important exception to the law of compulsory pilotage. A master or mate can, upon passing an examination and paying the same fees as the regular pilots, obtain a license to navigate any vessel belonging to his employer 'without incurring any penalty for the non-employment of a qualified pilot.' This privilege, which is extensively availed of, is resented by the Trinity pilots, to whom it is a serious blow. At Hull, the matter is made worse by the fact that many of the persons so licensed are foreigners. No doubt, as pilots say, one of the objects for which the Trinity House was chartered was to prevent foreigners from becoming acquainted with our harbours; but if these men be sufficiently acquainted with the Humber to pass an examination in its navigation, it is not easy to see how the withholding of a license will prevent them from guiding a foreign ship-of-war. That, by the way. It is said that an Act of the early part of the present century, dealing with a single article, madder, was admirably drawn except in one respect—it did not mention madder at all. A measure is now (August) being passed through parliament, one clause of which rectifies a somewhat similar omission in the Shipping Act of 1854. Section 340 relieves qualified masters and mates from penalties, as quoted above, and was intended, of course, to exempt them from payment of pilotage dues, which, indeed, was the primary object of the section. But it left them liable; and now, after thirty-five years, the error is being amended by the insertion of the words, 'or without incurring any liability for the payment of pilotage dues.'

There is a certain uniformity in the Trinity House pilotage system throughout its jurisdiction, and in order to see it at work it will suffice to glance at one of the English Channel ports—say Plymouth. There are there six cutters of from thirty to fifty tons, each carrying five pilots and two men, the latter becoming necessary when the pilots have been on; by one drafted into ships requiring their services. The profits are divided into twenty-four parts; the vessel, a pilot, and a man receiving respectively five, three, and two parts. By a rule of old standing, the details of which the pilots settle among themselves, three cutters cruise in a semicircle with a radius of twelve or fifteen miles; a fourth patrols the

entrance to the harbour; a fifth is within, ready to take the place of any cutter denuded of its crew; and the pilots of the sixth are off duty. These several places are held by each vessel in turn. The first time the writer saw a Plymouth pilot-boat was when approaching the harbour some years ago in a coasting steamer. A stiff south-west wind was piling water against the cliffs, and the breakwater could only be traced by a line of foam. A column of smoke became visible far out, near the Eddystone lighthouse, and a large steamer hove in sight, heading for Plymouth. On coming nearer, the union-jack—in nautical parlance 'the jack'—was hoisted to the foretopgallant-mast head; and as if awaiting the signal, from behind a sheltering headland a little yacht-like vessel stole, a red and white flag, the colours divided horizontally, at her masthead. On getting clear of the friendly promontory, she heeled over, almost burying a huge P (the initial letter of the port must be six feet long) which, with a number, disfigured her white mainsail, and then righting, flew seaward, now diving beneath a great green billow, or now climbing what seemed a perpendicular wall of water. The two vessels met; the pilot-boat described a sharp curve, the mainsail fell, and she swung round under the lee of the great steamer, which had meanwhile slowed. In a moment a small boat was dancing on the waves, and into it three men sprang, one of whom had donned a uniform of bright blue with brass buttons; and we watched with anxiety the perilous voyage to the rope-ladder which hung over the steamer's high black side. Hardly had the propeller begun to revolve before the rowers were again on board their own craft, and the little vessel hurrying across the dark threatening sea to meet a foreign-looking brig which was beating towards Plymouth.

It was a good day; perhaps a week would pass before they should meet another vessel. For the steamer, which had a draught of twenty-four feet, three pounds twelve shillings were received; and from the brig, rather less than half that amount, the men who actually piloted the ships receiving an eighth. The earnings of pilots vary so much that it would be difficult to give an average. Some of the London men receive over eight hundred pounds per annum—occasionally more than one thousand pounds is earned within the year—and a few large incomes are made in the Southampton district. On the other hand, at many of the smaller outports the average earnings do not exceed a pound per week. The large sums just named are obtained through the operation of the 'choice' system, by which the great steamship companies select pilots for their work. No doubt this good fortune is won honestly; still, where most are worthy and all are competent, selection looks like undue favouritism, and there will always remain a suspicion that to see a shipping-clerk is more efficacious than merit. On the whole, in spite of these prizes, the pilot's calling, laborious, dangerous, and highly responsible as it is, is an ill-paid one. The 'palmy days' of pilotage are gone. A Cunarder or Orient liner carries four or six times as much cargo as the foreign-going barque of thirty years ago, and pays but little more; masters and mates qualified to pilot their own ships are becoming each year more numerous; and for some time legislation has been

"the foe of a body of men who are regarded as monopolists.

Several attempts have been made to totally abolish compulsory pilotage, and Mr Chamberlain, when President of the Board of Trade, brought in a bill for the purpose. But a great vested interest had to be dealt with; it would cost some millions to compensate the present pilots and owners of cutters, and the project was dropped. There is much difference of opinion as to the merits of the compulsory system. On the one hand, there is so great an improvement in the lighting and buoyage of our shores and harbours, and charts have attained such excellence, that the highly educated men commanding large ocean steamers learn in their frequent voyages almost as much of channels and currents as the local pilots. There is a good deal to be said against forcing these men to pay for services they do not require; but, on the other hand, such officers can, if they desire, provide themselves with licenses, while the present system assures to the foreigner and the less confident navigator reliable assistance. Besides, the obligation to take a pilot is not more galling than the prohibition to load a vessel beyond a certain point, the government interference in agreements between master and crew, the official inspection of emigrants' food, or any of the hundred other steps the legislature has found it necessary to take in connection with shipping, in order to repress the recklessness of avarice in its dealings with human life. However, compulsory pilotage is probably doomed. Henceforward, every owner of a cutter and every pilot will, on receiving a license, be required to resign all claim to compensation in the event of the abolition of compulsory pilotage; and with the extinction of the present holders of licenses, the opportunity of the iconoclast will come. One step more, a step hotly urged, and with forcible arguments—the abolition of light dues on ships—and the *raison d'être* of the Trinity House will cease; and the besom of progress will then doubtless sweep away a most interesting survival of the infancy of English commerce.

A LEGAL SECRET.

By THOMAS ST E. HARE.

IN FIVE CHAPTERS.

CHAP. I.—CONSCIENCE-STRICKEN.

THE house in Lincoln's Inn Fields, from which the firm of Trench, Pilkington, and Trench addressed their numerous clients, was getting quite antiquated. It had stood there a century or more. Discreetly placed a little distance back from the roadway, like most of the legal houses in Lincoln's Inn, its angular architecture somewhat resembled a tumble-down house of cards; there were balconies, outside barred windows, upon which no one ever ventured to trust his weight, and there were stunted gables half-hidden by projecting walls. Upon the topmost gable was a weathercock; and this vane, pointing towards the north-west, reminded one that a gust of wind from that quarter might any day blow the old house down, as it had threatened to do already more than once; and would have done but for

the support of a more modern building on each side.

There had been many changes since the first deed of partnership between Trench, Pilkington, and Trench had been signed; for sometimes a Pilkington was senior partner, sometimes a Trench. But the designation of this legal firm had always remained unaltered. It had been known as Trench, Pilkington, and Trench time out of mind, and so it was still described. There had always been a trustworthy representative—always bearing either the name of Trench or of Pilkington, and always gifted with an acute ear for confiding clients.

For a day seldom passed but what some one driving up in his carriage brought with him a weighty secret; and the head of the house, whether young or old, was always there with his wits about him prepared to accept the trust. Before one partner showed any sign of superannuation, as it was shrewdly observed, another was skilfully trained to step into his place; so you might confide your secrets to the firm of Trench, Pilkington, and Trench with the same sense of security which you experienced when placing your money in the Bank.

The senior partner's room was large and oblong in shape, and with three dismal windows in a row; for these windows had iron bars, and the dust upon them was an efficient substitute for blinds. Between the bars could be seen a blurred forest of distorted chimneys. At the end of the room was a huge fireplace; and before the fire, which was burning brightly, was a great brass guard. It was an ideal chamber for the safe deposit of secrets; the walls were hidden by shelves, and on these shelves stood deed-boxes, some with names in full, others with the initials only painted upon them. At a desk, between the barred windows and the guarded hearth, sat an old man.

If any one ever looked like a living embodiment of secrecy, that could not be tampered with, this lawyer looked it from head to foot. His white shaggy eyebrows hung over his eyes and seemed almost to hide them: it was difficult to get more than an occasional flash from them—difficult to judge whether they were small or large. His nose was narrow, long, and hooked like a hawk's; and the thin lips were pressed together as if they had been sealed. He seemed at least fourscore years of age. The expression on his face appeared to imply that he had chosen the same motto as the Prince de Condé, and had based his character on the word 'Listen!'

It was growing dusk. As the lawyer placed his hand upon the bell at his side, the door opened, and in came a young man whose frank face was in striking contrast to the senior partner's. The old lawyer leaned back in his chair, and although he did not open his lips or even look up, his face plainly expressed these words: 'Well—what is it? I am listening.'

The young man, Sidney Trench, held a letter in his hand. He glanced at it as he stood over the fire, and then at Mr Pilkington. 'I have a little matter to settle,' said he, 'in Chancery Lane. I will not keep you waiting, sir; the carriage is at the door.' The old lawyer was Sidney's guardian. Mr Pilkington's villa, in one of the suburbs, was the young man's home;

it had been his home since boyhood. Again Sidney looked at the letter, and then handed it to the senior partner.

It was quite dusk now. Mr Pilkington, turning his back to the window, sat with his face towards the fire. He took the letter and said: 'What is this?' He bent his head over it. Could he read by that uncertain light? The expression on his face seemed to darken; the eyebrows contracted, and there was a slight trembling of the lips. Or was it the changeful reflection of the fire that appeared even to draw the colour from his cheeks? 'What is this?' he repeated.

'We are short of clerks,' Sidney explained, 'and I have heard of one, living near Chancery Lane, who is likely to suit. This is a letter strongly recommending him.'

Mr Pilkington tossed the letter angrily upon the table. 'We have enough—too many clerks already. Make them come earlier; keep them later at their desks!'

Sidney Trench deliberated a moment before making any reply.

'This man, Abel Norris,' he then ventured to plead, 'is a most deserving character. Besides,' he added, 'the poor fellow is almost destitute'—

'Sidney,' interrupted Mr Pilkington, 'how old are you now?'

'Twenty-four.'

'Ah! At twenty-one I became a partner.—Do you know that I shall be eighty this spring?'

'Yes; and I often think that you need more rest.'

'How can I take rest?' replied Mr Pilkington—'how can I think of retiring, while you are so young?—I do not mean in years,' he hastened to add—'I mean in worldly wisdom. You are too soft-hearted, Sidney, too easily impressed.'

Sidney smiled, but made no answer.

'When your grandfather died, placing me so early in life at the head of this firm, do you suppose I occupied myself with the troubles of destitute clerks? No, sir; I gave my mind to the affairs of clients; I listened to *their* troubles—family troubles, Sidney, of a very grave nature. I still listen to them day after day.' Mr Pilkington paused. For a moment, leaning his head against his hand, he looked as if all the accumulated troubles of distinguished clients to whom he had given ear for more than half a century were crowding upon him and bowing him down. 'To save great families from ruin—often from disgrace,' he presently resumed, 'is *our* business. Talk to me about that, Sidney, if you will; that is a subject which concerns us; not so your destitute clerks.'

From an intimate acquaintance with the aristocracy and their private affairs, ever since he was a young man, Mr Pilkington had learnt to worship rank. There were so many great families in the United Kingdom, so many members of the Upper House, whose secrets were locked up in his brain. But he had never been known to display indifference for the condition of those equal or beneath him in station; and Sidney Trench was puzzled to discover an adequate reason for his present attitude. It was so trivial a subject. A clerk, Abel Norris, had been asked to call. Sidney was too busy to see him; but he

had promised to look in upon the man after business hours. No motive, except the wish to aid a deserving character, had entered into his calculations. He hardly knew how to excuse his purpose to his senior where no excuse appeared requisite.

'I merely mentioned the clerk, sir,' said the young man in a conciliatory tone, 'as a reason for not driving back with you this evening. There is sometimes business connected with our clients upon which you wish to converse with me on our way home.'

But Mr Pilkington made no reply; he appeared lost in thought. Never had Sidney perceived a sign of mental abstraction in the old lawyer before. Men who are keenly occupied in the business of life are seldom absent-minded. The senior partner, from years of training, had an unlimited power of attention. Nothing was ever known to escape him. Again the young man regarded him with surprise and perplexity.

Presently, Mr Pilkington looked up. 'Come to me in the library after dinner,' said he; 'we will have some talk together there.' Then he suddenly added: 'I suppose this clerk has a large family dependent upon him?'

'No; only one daughter.'

Deeper shadows seemed to gather over the old man's face. But the shadows of night were also gathering outside, and the senior partner's room would have been almost dark but for the fire which was still burning though less brightly.

'Have the kindness,' said he as Sidney went towards the door, 'to send some one to light my lamp.'

When Mr Pilkington's lamp had been lighted and he was once more alone, he grew still more thoughtful. But at length he roused himself, tied up the documents on his desk, and rose from his chair. There was a green baize door opposite the windows. Mr Pilkington stepped softly towards this door and placed his hand upon the knob. He had to exert some effort to open it; for it fitted so completely that no voice, no conversation, could penetrate beyond. It opened with a muffled sound; and just behind was another door of dark oak. This he also opened, and entered a small octagonal chamber. It was an anteroom leading out upon the principal staircase; it was here that clients with matters for the senior's private ear waited his pleasure. But there was no one waiting now. The secrets of that day were all confided and locked away. It was now night, but not dark without; for through the window, barred and blindless like the windows in Mr Pilkington's room, the light from the crescent moon looked in over the crooked chimneys and down upon the senior partner as he took a bunch of keys from his pocket and opened a black deed-box standing amongst a number of others on the shelf.

The anxious expression which Mr Pilkington often had occasion to observe on the faces of his clients was now upon *his* face. It appeared as if some secret of his own oppressed him. Was that possible? Was it possible that this man, who had listened all his life to the secrets of other people without a sign of emotion, had a secret of his own? His hand trembled as he unlocked the deed-box, a box on which the name 'Rosamond Gage' was written; and in that moment of agitation the

thought doubtless crossed his mind of how much others had suffered while waiting here in this anteroom—waiting to be received by him; how bitterly many of them must have reviewed the irrevocable past—a past that contained all the painful details that these clients were ever eager to place before him! It was their business to save, as he had declared to Sidney Trench, great families from disgrace. Was Mr Pilkington meditating as to the best means of saving himself from being stigmatised by his family? He took from the box a bundle of letters and went back in his noiseless manner to his own room. Suddenly his agitation turned to anger. He raised his arm, as if an impulse to burn the packet had seized upon him. But the intervening guard, which had protected many a legal paper from the flames, seemed to recall him. 'No,' he muttered, with a stern look on his face, as though he were forcing an acknowledgment upon himself; 'she is not dead; it is not too late even now.'

For a moment he stood with his lips compressed and his shaggy eyebrows tightly contracted; and that intense listening look once more came over his face. Was he listening to his own conscience at last?

As the lawyer drove home through the west-end, where his clients lived in great squares and gardens, he sat in the corner of his carriage with his head bent, in a stern and brooding attitude. He took no heed of these mansions, with their brilliantly lighted rooms and aristocratic assemblies; to-night they brought no expressive smile to his face as he passed; he was not thinking about these people's secrets—secrets which if revealed might have filled the guests with consternation, and put every one to flight—he had other matters to ponder.

Mr Pilkington did not even glance out of window until his carriage reached an open heath. He then lowered the sash and drew a deep breath, as if the silence and moonlight which surrounded him were best suited to his present mood. The carriage presently reached the gates, which led through a winding avenue to the lawyer's villa. Upon a pedestal, on each side of the gateway, reposed a stony sphinx; and the lamps in front threw an uncertain light upon these grotesque figures. Even this old lawyer's face scarcely expressed more solemnity than the faces of these sphinxes; he might have caught their look and kept it, as fitted to his peculiar mental condition.

At a later hour of the same evening, as he sat in his easy-chair by the drawing-room fire, the lawyer's mood appeared but slightly changed. His eyebrows were still sternly knit; but there was a less compressed expression about his mouth, as if he were endeavouring to force himself to unlock some secret storeroom in his brain.

At an escritoire, on which there stood a shaded lamp, was seated a handsome woman. Glancing towards her, at last Mr Pilkington said: 'My dear, will you give me your attention for a few minutes?'

Mrs Pilkington at once put down her pen and wheeled her chair nearer the hearth. And as she bent her beautiful dark eyes upon the old man—some forty years her senior—there was a look in them of trust and devotion.

'I was thinking on my way home to-night,'

Mr Pilkington began in an unusually serious tone, 'about an incident which happened this afternoon. It appeared at first trivial; but it may be no such slight affair; it may lead to very painful disclosures. But much will depend, my dear, on your attitude. That is my opinion; much will depend upon that.'

An intensely troubled look came over the wife's face. She waited for Mr Pilkington to continue. She was too overcome to question him. The colour had left her cheeks; and although her lips were parted, as if she were listening with suddenly awakened dread, she scarcely drew breath.

But the lawyer seemed to expect no reply; he stopped only to ponder his own words. He did not raise his eyes—it was not Mr Pilkington's way, except on the rarest occasions.

'There is nothing, believe me, that need alarm you,' he presently resumed, as if conscious of her agitation; 'for when I observe that much will depend upon you, my dear, I ought to feel reassured; to feel otherwise would be to doubt your goodness of heart—to doubt even your readiness to forgive.'

As he spoke, Mr Pilkington drew from his pocket the packet of letters which he had taken from the deed-box in the moonlit anteroom that very evening.

'I have no wish to be mysterious,' the lawyer went on; 'but it has been my fortune in life—my destiny—to be the caretaker of other people's mysteries or misfortunes. Yes; it has been my fate. And yet, what lesson have I learnt? None. Is it not enough that I am forced to keep the secrets of our clients? It should seem so. But no; I must needs keep a secret of my own'—Mr Pilkington tapped the packet in his hand—'and it is contained in these letters. They will explain all that you have a right to know. And when you have read them—and I fear you will be deeply pained by the perusal—I shall ask you to listen, as I am sure you will, while I express my conviction, for I never can justify my conduct.'

With a trembling hand Mr Pilkington held the packet towards his wife. She took it with manifest reluctance. The look of trust had not yet left her face. It was evident that more than mere words even from her own husband's lips were needed in order to destroy the confidence she had placed in him ever since their marriage some fifteen years ago.

'I will not read them,' said she, holding the packet impulsively towards him. 'If you have thought it wiser to keep this secret from me, my dear husband, these letters are better placed among those deeds which do not belong to our life. For some good reason, I can never doubt, you have kept this secret. Let it be forgotten; let it be between us as if you had never referred to this subject. I shall always think of you, as I always have done, as a man of honour in whom every one places the utmost reliance. Why do you try to shake my belief in you?'

'For your own sake,' was the lawyer's reply; 'for your own happiness.'

Mr Pilkington's wife sank back in her chair, deeply perplexed, with the packet still clasped in her hands. How could the awakening of distrust in her husband bring happiness to her? She had married him when she was barely seven-and-

twenty, and he was then past the prime of life—sixty or more. But his love for her—she had always felt that—was one of genuine devotion. If he had a fault, it was one which most women will condone: he was jealous of every look or word she bestowed on others. But in his constant effort to conquer this weakness—the only weakness in his character—he had gained her admiration.

After a moment's silence, while looking thoughtfully at the packet, she spoke in a low voice. 'Let these letters be destroyed,' said she, casting a glance at the fire. 'I feel that to read them would be to raise some barrier between us. I have had one great trouble; I could not bear another.'

The lawyer made no reply; but a quaint expression passed over his face, as if his wife's words had touched him more deeply than was intended.

'I could not bear,' she resumed, 'to believe you distressed with the thought that in keeping one secret from me you had lessened my affection for you. Let me imagine—whether right or wrong—that your motive was a good one. It must have been! Few men have keener judgment. In your wisdom and supreme knowledge of the world, you decided to do what you have done; you have kept this one deed—whatever it may be—hidden from me. Let it be forgotten.' And as she spoke she rose from her chair, and stepping quickly towards the hearth, knelt down before the fire and dropped the packet into the blaze. 'There!' said she. 'It is forgotten. There is no secret that divides us now.'

Mr Pilkington in his motionless attitude watches the flames. The red tape which binds the packet grows black and breaks asunder; and then the scorched letters partially unfold themselves, and expose to view detached sentences and syllables as they curl into grotesque shapes. He never takes his eyes off the fire, but sits there lost in thought, even when every flimsy particle has sunk among the red-hot coals and vanished.

TELEGRAPHIC BLUNDERS.

'Get rid of Emma at once; exposure imminent.' Such were the contents, startling and unexpected, of a telegram opened by the wife of one of our City men during his absence. How many sighs and tears, how much doubt and anguish resulted, and with what difficulty and persuasion, incredulity was overcome and confidence restored, who shall tell. Suffice it that tears gave way to laughter when it was explained that 'Emma' was the name of a big mine in America, and the mysterious message only a hint to sell out shares in that notorious undertaking.

There was no blunder, telegraphic or otherwise, in the transmission of the above message, but it will serve as an example of the ambiguity of the modern business telegram. Nine out of ten of the messages passing to and from business houses are so abbreviated, so full of technical terms, as to be an absolutely unknown language to any one outside the particular business concerned.

There is no occasion whatever to condemn this practice; indeed, the manifold advantages secured by the use of abbreviated or code telegrams, principally as regards economy and secrecy, immeasur-

ably outweigh the disadvantages of occasional misunderstandings. It must, however, be admitted that a slight telegraphic blunder which would not affect the sense of a plainly worded message, might entirely obscure or alter the meaning of an abbreviated or ambiguous one. The person who despatched the comforting assurance, 'made all right,' could not, of course, foresee that the failure of two little signals would transform his message into the alarming statement, 'mad all night'; but the economist who condensed the same meaning into the single word 'settled' could not loudly complain that the message as delivered contained the unmeaning and somewhat irritating word 'nettled.'

The blunders of the telegraph arise from more than one cause. In addition to those produced by indistinct or illiterate writing, a very large number are due to mechanical or electrical faults in the apparatus or on the line. The Morse code or alphabet, by means of which the pulsations of the electric current are read, is, as most people are aware, composed of dots and dashes, or rather short and long signals, combinations of which in different orders and quantities form the letters of the alphabet. These signals are liable to mutilation in three ways: by 'failing,' or the loss of a signal; by 'sticking,' or the running together of two signals; and by 'splitting,' or the breaking up of one signal into two or more. To illustrate this, let us take the letter 'R,' which is expressed by a dot, a dash, and a dot - - - By the accidental omission of the first or last dot, it would become either - - N, or - - - A. By the running together of two signals it would again, although not perfectly, become - - N, or - - - A, while the splitting up of the dash would transform it into H - - - - When it is remembered that all of these faults may be, and occasionally are, present at the same time, the mystery of some telegraphic blunders is explained.

A few years ago a message was received at a certain town in the north of England addressed, 'The Chief Baconstable.' Unfortunately, the contents afforded no clue to its destination, and after going round to all the Baconstactors in the town, it was reported as 'undelivered.' Speedily came the corrected address, 'The Chief-Constable.' In this case the hyphen between the two words being badly signalled was translated 'Ba' and tacked on to the next word. This faulty signalling, or, as it is technically called, 'bad spacing,' is another fruitful source of error. In conjunction with a badly written letter, it produced the address 'Mice Cavern,' instead of 'Mitre Tavern;' and in transmitting the report of a lecture on 'Poetry,' made the lecturer refer with enthusiasm to the 'tender melody of cats,' which should, it is scarcely necessary to add, have read 'Keats.' Another lecturer, dealing with the 'Growth of happiness,' had the title converted into the 'Groans of happiness'—a somewhat peculiar error, but one well within the bounds of possibility.

A well-known refreshment caterer in Manchester received an order from a school manager for four hundred beans. This order he transferred to a greengrocer, and it was only on inquiry being made as to the real quantity required, that an error was discovered. The original order was for four hundred *burgs*. A student, anxiously

awaiting the result of an examination, was not relieved from suspense on receipt of a telegram containing the words, 'First or last.' Luckily, a repetition of the message corrected this, substituting the gratifying intelligence, 'First on list.' A gentleman telegraphed to his servant, 'Get me good seat theatre to-night,' and was not very well pleased on his arrival to find an orthodox theatre *hat* provided, but no *seat*.

During a meeting of the British Association some years ago, a sermon was preached by a reverend savant. The preacher's text, as reported by the telegraph, was taken from 'The *Acts* of the Apostles,' and one of his sentences read, 'the soups of just men, made perfect.'

Who has not heard or read of the party telegraphing for his *coat* and receiving a *cow*, or of the gentleman absent from home, informed of the birth of a box! Here are, however, other versions of these cases, rather more circumstantial, although probably not more authentic. A reporter absent from home on business, wired for his *new coat*. Reply: 'What do you mean by *neut cow*? Don't understand your message.'

It is, however, in dealing with press or newspaper work, in which the dangers of indistinct writing are enhanced by the system of abbreviations used by reporters, that the great majority of telegraphic blunders are committed. Fortunately, indeed, is it that there stands between the copy and the public the all-knowing, long-suffering sub-editor, else would the newspaper hold a lower place in the world than it does to-day. What, for instance, would be thought of the paper which, publishing a well-known politician's speech, closed it with the extraordinary words, 'All things come to the man with wants!' or of the sporting print which allowed it to become public that Lammia would not run at Newmarket, as she was 'touched in the mind!'

The telegraphist engaged during a big cricket match had perhaps some excuse for describing the pause for refreshment as 'the luncheon internal' instead of 'interval'; but what can be urged for the man who, in the middle of a prosaic provision market report, alleged that 'well *curld* hairs' not over fifteen pounds-weight realised good prices! It cost the press-man an extra thought to discover that 'well *cured* hams' were the articles reported on.

Not many months ago, a prominent party-leader, speaking in the provinces, mentioned by name a number of local gentlemen, praising them for their zeal and industry in the cause, adding, as an emphasis: 'These are all friends, old well-known friends.' What would have been the feelings of the speaker, or of those mentioned, had the report appeared in the newspaper exactly as it was telegraphed—that is, 'These are all friends, old well-known frauds!' In describing a horse-race, the reporter wrote, rather indistinctly, it is presumed, 'The favourite made all the running, and won by two lengths.' The telegraphist who signalled the message was evidently not of a 'sporting turn,' as the best he could make of it was: 'The favourite made all the winning, and ran by twilight.' Another description was: 'The pair ran together to the distance, where Avon Belle got in front, and eventually won, after a good race, by a *whisk*.'

A great many yarns of peculiar errors are

current in the service, many of which are very comical, but, bearing the stamp of having been concocted for the sake of the joke, are not to be put forward as genuine telegraphic blunders. One of them, however, as an example of telegraphists' humour, may fitly conclude this paper. A press-man reporting a big fire, gave prominence to the fact that a gentleman in the neighbourhood had lent his private hose-pipe. By the time the report reached its destination the sentence had become, 'Mr W—— kindly lent his *nose-ripe*.'

AN INDIAN JOURNEY.

THERE prevails among my sex at home the idea that thrice blessed are those fortunate sisters whose destiny leads them to spend their lives on the sunny plains and verdant hills of India; that their time is spent in a whirl of gaiety tempered with the luxurious ease of an Eastern life. This may be the case with a favoured few; but many an officer's wife in India has to rough it in a way which would rather appal the ordinary English-woman, were she suddenly called upon to undergo an experience similar to that which I am about to relate.

In the month of March 1888, my husband was unexpectedly ordered to proceed at once to join a new Goorkha regiment at a station called Kaludanda. We were at that time in the Southern Punjab, having just settled down in a comfortable bungalow, after a winter spent by me in Peshawar, and by my husband under canvas on the Afghan frontier. But such is the lot of a soldier's life, and custom had hardened me to the possibility of having to pack up my household gods and be off at a moment's notice. A most important matter, however, was to find out where the place was to which we had been ordered; and after inquiry among our friends in the cantonment, we discovered that only the vaguest idea existed as to its whereabouts, and how to get there no one knew. The reason for this was that it was a perfectly new station, formed for the accommodation of the new Goorkha regiment, which had only been raised a short time before. A telegram addressed to Kaludanda, however, after some delay brought back an answer informing us that our future home lay in the hills of the North-west Provinces, about thirty-five miles from the railway station of Najibabad, and that there were as yet no houses built. This did not sound very promising; and I regretfully gazed on the bare walls and rubbish-strewn floors of my once bright little bungalow, and bade a tender farewell to my favourite pony, which had been transferred to a new owner. But there was no time for sentiment. The bullock-carts were creaking off to the station with our baggage; and after a hurried last look at our old regiment, who happened to be holding their regimental sports that afternoon, we were off in the train for Lahore.

Nothing noteworthy happened during this part of the journey. On arriving at Lahore next morning, we had the customary dear and horrible breakfast at the station, the nastiness of which

must be experienced to be realised. Scarcely had we finished, when we were hurried into the train for Saharanpore, which was reached at 12.30 that night, after a long day in a hot and dusty carriage. Then, amid the dense crowd of jabbering bundle-laden natives, my husband had to rush off to collect our dazed and sleepy servants, and send them with our beds and baggage to the dak bungalow where we were to pass the night. When we got there, we found that all the rooms were occupied; and so I had to sit yawning for another hour while our tent was being brought from the station and pitched in the compound. It was long after two o'clock before I got to bed.

Next morning, another railway journey brought us to Najibabad, the nearest station to Kaludanda. We were relieved to see our horses standing safely under a tree close by, they having been sent on in advance. Here I first saw a Goorkha, for a funny little havildar met us at the station with a letter containing directions for our further journey. He was only about five feet high, and very queer he looked after the huge Pathians and Sikhs that I had been accustomed to in the Punjab. He informed us that we must spend the day here, as it would be too hot to cross the Terai, through which our road lay, under the blazing sun. We accordingly camped in a dilapidated empty bungalow near the station, which was the only shelter to be had; and our servants soon produced a meal of the inevitable *murgi* and *chapatis*, the national Indian bread, which is simply a horrible thin leathery cake of half-cooked flour and water. This repast over, we went out to look about us. We were just at the edge of the thick belt of jungle which lies all along the foot of the Himalayas; and beyond the trees we could see the forest-clad hills rising up ridge after ridge to the magnificent snowy peaks over a hundred miles away.

Under the guidance of our friend the havildar, we set out to explore Najibabad, which is a large native town, but very much out of the way of travellers, and where I was consequently the object of what was for me rather unpleasant interest to the inhabitants. As a result of this I soon retired to the bungalow again, where we rested until evening, when my husband went off to despatch our servants and baggage in bullock-carts on their way through the jungle.

We were up next morning at three o'clock, and while my husband packed our beds, I hurriedly made some tea in our camp-kettle. Then strange noises in the darkness outside indicated the arrival of the elephant which was to take us across the jungle to the foot of the hills. The beds and bags being tied on the pad by the *mahout* as the great beast knelt at the door, I was hoisted into my place; and away we paced in the darkness through the sleeping city, the elephant filling the narrow streets, so that one could touch the houses on either side. Then out into the eerie blackness of the forest, I filled with a curious sensation at the novelty of my position; for here were we in the middle of the night plunging into a jungle swarming with wild animals of all sorts, the only two white people within many miles.

After two hours of monotonous jogging through the darkness, a pink glow appears in the eastern sky, and soon the rapidly breaking dawn enables us to see about us. We are passing along a

narrow path, a wall of foliage on either side, and the trees meeting overhead. The mysterious sounds of night give place to the voices of the awakening birds, the crow of the jungle-cock, the shrill screams of flocks of parrots flashing like meteors through the air, and the varied notes of many others hidden from our sight. As the sun rises, the full beauty of the forest becomes revealed. On every side are huge trees, some hung with festoons of thin snake-like creepers; others destitute of leaves, but covered with beautiful tulip-like scarlet flowers; others, again, a blaze of crimson foliage. Every here and there opens a lovely little glade, dotted with great clumps of tall graceful bamboos and big-leaved plants. Wild pig, deer, and peacock run across our path; and on the road in front I see what is apparently the familiar barndoor cock scrapping as vigorously as if he were in the farmyard at home, although he is a *jungle murga* in his native wilds.

The most startling spectacle is, however, when, after much crashing of branches has been heard, a herd of a dozen wild elephants crosses the path about fifty yards ahead, deigning to notice their captive brother only by a disdainful glance and flourish of their trunks. The mahout informs us that they are very common in this district, but quite inoffensive, unless one happens to meet a rogue in a bad temper. This intelligence does not add to my comfort, especially as he casually remarks that there is more than one rogue in the neighbourhood. Two or three small streams are cautiously forded by our elephant, which is evidently getting hungry, for it breaks off branches and munches them as it goes along.

At last at ten o'clock we reach the small village, lying in the mouth of a gorge at the foot of the hills, where we expect to find our servants and breakfast; and I gladly scramble off the back of the beast which has been my uncomfortable resting-place for the last six hours. As we come up, we find our tent pitched and the baggage being got off the carts, which have been all night on the road. During the last hour, heavy black clouds have been rolling down the hills, and we have scarcely got under cover when the storm breaks with a deluge of rain, in consequence of which we get nothing to eat till past three o'clock, by which time we are ravenous, as may well be imagined. After this, the *thanadar* or head-policeman of the village is summoned, and the possibility of procuring coolies is discussed; for at this place the cart-road ends, and everything must now go forward on the backs of men or mules. He promises to have sufficient men collected by to-morrow morning, and with many salaams, departs.

The rest of the day we spend rambling among the rocks and under the trees, and revelling in the freshness and verdure of everything after the arid desert of the Punjab.

Early next morning the *thanadar* appears, driving before him, with much shouting, a crowd of almost naked villagers, who with a great show of reluctance and expostulation hoist our boxes on their heads and disappear up the winding path. These being safely despatched before us, we start to walk to our next camping-ground, fifteen miles farther on, up a most exquisite gorge with precipitous sides, covered with foliage, and a foaming

mountain torrent dashing over the rocks at the bottom. The narrow path winds along one side—in some places a mere ledge on the face of the rock overhanging the stream, in others running through groves of the most magnificent bamboos. Once we see an immense troop of monkeys jumping from tree to tree, and drinking in the stream, perfectly undisturbed by our presence. So we go on steadily rising mile after mile, each turn of the road disclosing a scene of greater beauty than the last. Every now and then we come upon some of our property lying on the path, while the bearers squat beside it smoking a very primitive pipe made of a rolled-up leaf pinned by a thorn. But they are inexorably driven on by my husband; for the only chance of getting our baggage up at all is to keep it in front of us.

A long string of sheep passes us on their way to the plains, each with its little pack on its back. They have come all the way from Bhotan, across the highest passes of the Himalayas, where nothing but a mountain sheep could find a footing. They carry down borax and salt, and take rice and other grain back to the hills on their return journey, being altogether about three months on the road.

As we are beginning to look out anxiously for our next camping-ground after our long climb, we are astonished by the appearance of a Pathan sepoy riding on a mule. He brings us a letter, and says that there is a camp of Bengal Sappers a couple of miles further on. The letter turns out to be from an old friend; and when we get into the snug little camp we are warmly welcomed and find lunch ready and acceptable.

That evening, after dining in the tiny mess tent, carpeted with the skins of the many victims of our host's rifles, we sit outside listening to the piper of the company, who performs with extra vigour in honour of his increased audience. As I am tired, I soon retire to my tent, only to be wakened an hour after by the shouting of the servants, while something plunges violently among our tent-ropes. This turns out to be a leopard, which has been prowling about the camp, probably on the lookout for its favourite morsel, a fox-terrier.

Next morning we start on the last stage of our journey up a very steep ascent of three thousand feet to the top of the mountain which is our destination. We are mounted on mules kindly lent us by our friend, who rides a part of the way with us. Our steeds scramble over the rocks, for path there is none, in a way which makes me feel very uncomfortable, until I find that they are as sure-footed as cats, whether picking their way along a knife-like ridge of rock with a precipice on either side, or over the slippery surfaces of a pile of boulders. As we rise, the character of the trees begins to change; magnificent rhododendrons, with trunks a yard in diameter, a blaze of crimson blossom, shine out among the dark foliage of huge oaks draped with moss and lichens; and every here and there groups of lovely pines remind us of Scottish woods.

On reaching the top at last, we are rewarded by a view of extraordinary beauty and extent. On the north we look down into a deep valley, green with fields and dotted with little brown villages; while beyond that, the hills roll away back to the peaks of the Himalayas, running in a chain of

dazzling whiteness for hundreds of miles along the horizon. To the south lie the plains, stretched out like the sea as far as the eye can reach. As we ride along the ridge we see glimpses of tents among the trees, and come upon a working-party making a road to a spring. This path leads into a cluster of thatched mud huts, the temporary regimental lines; and above them on a knoll are the tents of the officers. Our arrival seems to create great excitement among the men, which is explained by the fact that I am the first white woman the most of them have ever seen, they being raw recruits, who have only just arrived from the high hills under the snows. All the accommodation to be had is a wretched little hut, beside which we pitch our tent, and the journey is over.

THE WORK OF THE ROYAL MINT IN 1888.

THE Report of the Deputy-Master of the Mint for the year 1888, which has been recently issued, presents many features of interest. We will preface the information which we have gleaned from it with some particulars of the Mint establishment.

The work of coinage was transferred in 1810 from the Tower of London, where it had been carried on for many years, to the present Mint on Tower Hill. The head of the department is the Chancellor of the Exchequer for the time being, who is *ex officio* Master of the Mint, the practical direction of the work being placed in the hands of a permanent officer, the Deputy-Master, who is responsible for its due performance.

From the English Mint is supplied the coinage of the whole of the British Empire, including the colonies, with the exception of Australia and the East Indies, which are supplied with coin from branch Mints established as to the former country at Sydney and Melbourne, and as to the latter at Calcutta and Bombay.

The number of each denomination of coin that is issued varies considerably from year to year, the demand naturally determining the supply. The coinage of medals for the army and navy and the Board of Trade, as well as those given by the Royal and other Horticultural Societies, the University of London, &c., are struck in the Mint, and their preparation forms a considerable part of the work of the die department. In this connection may be mentioned the preparation and issue to the public of the medals struck in commemoration of Her Majesty's Jubilee, the issue of which was brought to a close on the 31st of December last.

Gold coin is issued by the Mint to the Bank of England at nearly the market value of the bullion; but a considerable seigniorage or profit accrues to the Mint from the silver coinage, that department being empowered by Act of Parliament to coin every pound of silver into sixty-six shillings; while it is enabled to purchase silver bullion at a much lower price. A large profit is also produced by the bronze coinage.

Adverting to the Deputy-Master's Report before mentioned, we find that the pressure of the demand for both imperial and colonial coins made

it necessary, towards the close of 1888, greatly to prolong the hours of work, and that this pressure continued for some months. The special requirements of Hong-kong, for instance, involved the coining, telling, and packing of many millions of small pieces, entailing a great amount of labour. The total number of good pieces of the imperial and colonial coinage struck at the Mint during the year 1888 was 52,153,700; and their value, real or nominal, £3,363,524. Of these pieces, 28,856,162, of the real or nominal value of £3,070,053, consisted of imperial coinage, and the remaining 23,297,538 pieces (£293,471) of colonial coinage, chiefly for Hong-kong, Canada, Newfoundland, and the Straits Settlements. In addition to the above, 6,458,134 pieces, being 11·02 per cent. of the whole coinage, were struck, but were rejected by the Mint officers as incorrect in weight or of defective appearance.

The gold coinage of the year 1888, although exceeding by £283,000 that of 1887, was below the average; but the demand for silver coin was excessive, notwithstanding an exceptionally large issue in 1887. The bronze coinage was somewhat less than in the previous year.

Of all the denominations, more halfpence were struck than of any other coin, the number being 7,347,200. Pence came next (5,268,400), then shillings (4,645,080). Of sixpences, 4,015,400 were coined; of farthings, 2,150,400; of sovereigns, 2,032,900; of florins, 1,546,380; of half-crowns, 1,427,184; of threepences, 511,368; and of crowns, 161,568. No half-sovereigns were coined in 1888. 124,158 fourpences were struck, but these were entirely for British Guiana, where this coin is much in request for payment for taskwork.

Silver bullion was purchased by the Mint for coinage during the year at an average price of 42½d. per ounce; and as silver coin is—as before stated—issued by the Mint at the rate of 66d. per ounce, the seigniorage or profit which accrued to the State was at the rate of 23½d. per ounce, or 53½ per cent., as against 48 per cent. in 1887. In the year 1871, the rate of seigniorage was 9½ per cent. only, and it has been gradually increasing since that period. The profit on the silver bullion purchased in 1888 amounted to £176,339; and the excess of receipts over expenses was £137,077, being the largest amount realised in the last seventeen years, with the exception of 1887, when it was £187,753.

The amount of gold coins from Australian branch Mints received by the Bank of England in 1888 was £3,535,000, in sovereigns; as against a yearly average of £1,947,000 during the ten years ended 1887. The receipt of these coins at the Bank fell in 1887 to £202,000, in consequence, it is presumed, of the depression of trade in Australia during the year; and it is satisfactory, therefore, to note the large amount imported in 1888.

The number of Medals of various descriptions struck during the year was 3885, of which 1595 were gold and silver Jubilee medals, and 2025 war medals.

There was, it is satisfactory to observe, a considerable falling off in the number of prosecutions for offences against the coinage laws, these cases having been 150 in 1888, against 226 in 1887; and the number of persons charged 255 against

397. There were only five prosecutions during the year for uttering 'Hanover' medals, as against nine in 1887; and it would appear that the Counterfeit Medal Act of 1883 has almost put an end to offences of this description.

In connection with the Report which we have had under review, reference may here be made to the Light Gold Coinage Bill, which has recently been introduced into parliament by the Chancellor of the Exchequer, and to carry out the provisions of which an estimate has been submitted to the House. The Bill is, the Chancellor stated, a preliminary step towards redressing what is generally admitted to be a considerable grievance—namely, the existence of a large quantity of old light sovereigns and half-sovereigns. He estimates that the number of such coins, issued in former reigns, that are now in circulation amount to about £4,000,000 in nominal value; and he proposes to call in these coins as far as possible and purchase them at par. In fact, the government is prepared to adopt the principle first propounded by Aladdin's wicked uncle, when he exchanged old lamps for new ones, and to give a brand-new Queen's head for a battered effigy of George or William, the government taking upon itself the consequent loss (estimated at £80,000) of the transaction. The Chancellor of the Exchequer proposes next session to deal with the whole question of the gold coinage of the United Kingdom.

AT TWILIGHT.

I.

THE speedwell folds her leaves of blue,
In tears that each dark petal gem
With many a dainty diadem
And spray of glistening, starry dew;
While slowly stealing up the vale,
O'er banks and dells and mossy crags,
By many a pool of reedy flags
The mists of twilight softly sail.

II.

THE very air breathes peace. The light
Dying on rosy, far hill-tops,
Peers through the silent, dark fir-copse,
And fades into the gray of night;
Then, opening 'mid the solemn strife
Of day with dark, the spirit's eye
Recalls the loving memory
Of some whom Death hath crowned with life.

III.

Swift wakens all the shadowy past—
Forgotten words, and joys, and tears;
The buried hopes of bygone years,
The dreams that were too bright to last—
Come back—by new, diviner birth,
Each with a radiance of its own,
From that far land unseen, unknown,
Beyond the shadows of this earth;
Where, having drawn a nobler breath
Of life and love than earth can give,
Man, by the mystery of Death,
At last triumphant learns to live.

IN A COUNTRY CHURCHYARD.

NESTON, CHESHIRE.

THE words 'In a Country Churchyard' will be for ever associated with one of the sweetest utterances in our English tongue, and dull and prosaic indeed must seem the words of any one who selects the same theme. The hand of a master has struck the lyre, and the measured strains will reverberate through the ages, touching and soothing human hearts with their hallowed tones. Gray has sung the hymn of our quiet dead, and we who fain would sing are silent listening to the pure notes. He has told us the story of their tranquil slumbers as it will never be told again, and it would appear that there is 'nothing more to be said,' yet—standing here in God's acre, and looking around upon the resting-places of some of those who have stood side by side with me in Life's battle—it seems to me that some brief reference to them might not prove altogether unprofitable or uninteresting.

As I seat myself hard by the church porch, the shadow of the tower glides slowly in among the tombs, and overcasts them one by one. A thrush that has been piping unseen in the branches of a weeping elm, drops quickly to the ground, hops lightly over a half-buried slab of red sandstone, and escapes with a momentary flutter of his moss-brown wings into a neighbouring coppice. Village children released from school pass down the path and, wandering in among the tall grass, gather the nodding buttercups. Soon the familiar click of the west gate is heard, and I am again alone with my thoughts.

The square church tower, which has kept watch century after century over the sleepers below, is massively built of red sandstone, and is embattled as if the builder had contemplated the attacks of other than spiritual foes. The windows are narrow, and the door is a marvel of strength. It is studded with mighty nails, and when the sexton has shot the sturdy bolts into their sockets, the belfry appears well fitted to sustain a siege. It

may have sustained many in its time; but History is very reticent about this quiet corner of Old England. The church existed at the Norman Conquest, and there are curious Runic stones lying in the belfry, which were disinterred during the work of restoration, and which point to an early Saxon burial ground. A few miles away is a gigantic stone, which the legend saith was launched from the hand of Thor, the mighty Thunder god, and gave its name to the adjacent village, Thor-Stone Town (Thurstaston). Hereabouts, too, were found a number of skeletons upon a jutting cliff near the marsh. The bones of one were of colossal size—the leader, probably, of the band which fought and fell by the water's edge when there was none to sing of their valour.

Since that remote period, stirring scenes have been witnessed from this spot. Vessels with prows like the fierce monsters of stone which spring from each side of the tower have oftentimes grated upon the shingle and loosed their viking crews upon the land. Roman and Norman have left traces of their presence, and psalm-singing Ironsides have trooped to the beach in stern array; but the churchyard is as though these things had never been.

Year by year it has gathered in its harvest from the village. Generation after generation of rustics have toiled a brief space, and have been received into its friendly bosom. They have lingered here after service and have 'turned in' at twilight to smoke and meditate; and at last, one by one, they have fallen out of the village circle to take up their abode here.

An old man who sleeps by the roadside yonder, and upon whose tomb are the familiar lines beginning 'Remember me as you pass by,' spent the greater portion of the last ten years of his life by his wife's grave. He came in the early morning, and after removing any microscopic weed that might have showed itself since the previous evening, would light his pipe and solemnly contemplate the stones in his vicinity. He went away regularly to his meals, and as regularly took his afternoon nap on the grass by the graveside.

Shortly before his last visit to the cherished spot, he requested me to decipher for him the dates upon several of the gravestones; and we conversed about many whom we had known in life, and who had passed away. I remarked that the churchyard was a very pretty place, and his face lighted up as he rejoined: 'Ah, mester, I've always thought I should like to be buried here, for'—looking around—'you see, there's such a splendid view from here.' This was uttered in good faith; and the old man seemed convinced that neither coffin lid nor churchyard clouds would obstruct his view. Perhaps they don't! In a few brief weeks he came to his favourite haunt to stay. 'Poor old William!'—the flowers upon your grave have run wild long ago, and no one seems to remember you as they pass by.

The country churchyard is not without the dust of those who have stood in the forefront of the battle. When the voice which has held the senate enthralled, grows strangely silent; when the pen of the great writer has fallen from his nerveless fingers for ever, and the blinds are closely drawn in the darkened chamber, they talk in subdued tones of the disposal of the casket which enshrined so much that was rare and noble, and which is now, alas! but a casket, spoken of as *it*. First one, and then another, remembers to have heard him speak of a churchyard that he had known in his boyhood, where the stones were moss-grown and not always perpendicular, but wherein was such peace that the very remembrance brought with it an inexplicable calm. And so it comes about that in the far distant hamlet, where the fame of the dead is but a faint echo, the village boys and girls learn special hymns, and the village organist practises the solemn strains of the Dead March.

There is one such reposing within a few paces of where I am sitting. He had fought long and grown gray, but his voice rang like a clarion to the last. On the very evening when the summons came, he was fighting a good fight; but he was weary, and spoke of rest. A few minutes afterwards he was bidden to turn aside from the struggle. When they brought him here, the organ pealed in an unwonted manner, and the church was filled with the scent of the flowers they had heaped above him. Strange faces thronged the pews that day, and a vast multitude walked and crowded about the graves outside, but he who had been so strong was borne silently through their midst and left here with tears. More than one bishop and a long train of clergy led the way. He was not of their order; but he had fought in the van for the pure and the true, and his place was hard to fill.

A few steps away is a plain cross of Yorkshire stone, half hidden in ivy, and as my gaze rests upon it, and my memory travels back, I see her whose name is inscribed on the base. Her hair was a mass of burnished gold, and as she rode through the village street followed by her favourite collics, the villagers would glance furtively at her, and turn and gaze until the bright hair and blue riding-habit were out of sight. She was not young, and she was unmarried. The gossips

called her eccentric, and I heard by chance of some of her eccentricities. The beggars who came to her gate were frequently invited in, and were treated as honoured guests, and served with a sumptuous repast. On one occasion, when a poor shivering woman stopped at the front door of the villa, the lady of the house came out, looked at the defenceless feet of her visitor, and straightway removed her own shoes and handed them to her. A rough young fellow, who had been in the habit of abusing his donkey told me that he used to call at the villa every week for a silver coin, with which she bribed him to be kind to his beast. Eccentric, perhaps; but there lived One once who did many unfashionable things, and the world thought Him eccentric.

She, too, was called suddenly away. There was an organ recital at the parish church one evening, and the whole of the village attended the unusual entertainment. Among the items on the programme was, 'Oh for the Wings of a Dove,' with the addendum, 'By special request.' When the piece was played, the 'eccentric' lady abruptly left the church. The golden hair was seen in the village street no more, and the blinds of the villa were not raised next morning, for the lady had passed away suddenly during the night. It had been at her request that the special piece was played; and, before the day dawned again, the wings were hers.

Under the shade of a laburnum on my right rests one who was not less lovely in her life. As I think of her, the chamber where she lay so long comes vividly into my remembrance, and it seems that the last weary months she spent there were in reality her life, while all her preceding years were but an infinitesimal part of her existence. The windows of the chamber had a pleasant outlook upon the village street; but it was ordained for 'Auntie' that she should lie still for nearly a year, and that she should not have power to move her head even an inch. The right hand, too, had to lie motionless upon the counterpane. She was thus precluded from approaching the window; but a mirror was so arranged as to show all that was passing below. It reflected a brilliant spectacle one day. They were holding the village carnival, and the gardens for miles around had yielded up their brightest blooms to crown the white wands of the processionists. The street for the moment became a moving mass of flowers, and as they passed beneath 'Auntie's' windows the band paused, and the wands were lifted in greeting to her who would walk with them no more. On another day, as she lay there, the bells danced merrily in the steeple, and there was a sound of wheels outside—for it had been arranged that they should come to her direct from the church.—Now, when people lie dying their thoughts are apt to wander away to distant scenes. No heights are too ambitious for them. They will sometimes climb the stars, and mount and mount until even these are left far below. Some such thoughts may have occupied 'Auntie's' mind—who knows?—for when the wedding party, all white-robed and radiant, came into the room, she burst into tears.

Shortly before she came to lie there, the little girl who had always been with her had 'gone away.' She explained that their eyes had been directed to the earth, and that the little one had been taken up so that as they still looked at her

their gaze would also rest upon the golden pavement of the new city. 'Auntie' spoke bravely; but when the children raced past the house on their way from school, she would draw back from the window and cover her face with her hands. They had no portrait of the child when she went away; but a great artist painted a picture of 'Little Mrs Gamp,' and large engravings of it were scattered through the country. The quaint little figure was so like the little girl whom 'Auntie' had known, that it was framed and hung at the foot of the bed. There was yet another picture of a little girl looking at the stars, but 'Little Mrs Gamp' had the place of honour, and 'Auntie's' glance rested upon her continually. A few days before she was taken out into the sunshine 'Auntie' had a strange dream. She found herself looking for 'Little Mrs Gamp' among a multitude of strange people, and when at last she discovered the object of her search, the little one lifted up a tear-stained face, and said that she had thought Auntie 'was never coming.'

It was found afterwards that she had given directions that the furniture of her room should be re-arranged, and the pictures removed, that she might be the more easily forgotten. Her last wish was, however, disregarded. 'Little Mrs Gamp' looks down upon the vacant bed. 'Twinkle, twinkle, little star!' with her head poised upon one hand, is still gazing reflectively upwards at the blue—and the sunbeams wander in through the blinds and linger on the empty pillow.

Very tragic was the departure of one who lies in the south-west corner of the churchyard. He was the village schoolmaster, and had arranged to take the Sunday evening service for the organist of a neighbouring church. He laughed as he set out upon the journey, and was light of heart, as is often the fashion of those who go forth to die. The church was many centuries old, and storms innumerable had swept up from the sea and fallen upon it. Strange mutterings began to mingle with the service, and little gleams of light darted through the windows and leaped playfully on the walls. The mutterings rapidly swelled into a voice of terrible anger, and the lamps grew dim as the blinding flame hissed past the windows; but the people still worshipped. It was the Almighty who was speaking, and they bowed before Him in His sanctuary, having faith that their pleading rose clear above the raging of the storm. Long-drawn crashes, as of the pouring forth of an avalanche of thunderbolts, followed; and many glanced fearfully upward, thinking that the tower had been torn away. The calm voice of the minister was heard reading the lesson, and, as he concluded, the organ gave out the strains of a familiar chant, and the congregation rose to sing the 'Magnificat.' The triumphant ascription, 'My soul doth magnify the Lord,' ascended—and then they stopped, for 'at the voice of His thunder they were afraid.' As the words left their lips, a fierce light was all about them, and they were flung back in their seats, deafened by the blast which shook the building. The wall of the church was ripped across, as one would tear a piece of old parchment, and mortar and rubbish were hurled through the air and rattled into the pews in the darkness—for the lamps had gone out. Then out of the silence was heard the voice of one praying aloud, and there was a sudden tramp-

ling of feet in the aisles. Many had fainted, but at last all save two gained the open air. One of the two who remained in the church all that night was the schoolmaster. I saw him next day lying as he had fallen back from the stool, with his fingers extended just as they had left the keys of the instrument. There were pulpit references afterwards, and the preachers spoke of one who in olden times was whirled heavenwards with chariot and horses of light.

Thus, as I look around, grave after grave tells me its story. 'For here we have no continuing city' is written on an ancient monument directly in front of me; and as I look steadfastly upon them the words seem to repeat themselves again and again in solemn tones. Names which follow with the explanatory 'Wife of the above,' 'Daughter of the above,' 'Son of the above,' force themselves upon my notice, and I find myself counting the spaces which intervened as they fell one by one into eternity, just as tiny drops of rain fall into the ocean. The inscriptions are as words from the silent land, spoken by those who have journeyed thither.

It is good for us that they have lived—ay, and it is good for us that they have died; out of the tomb of our shattered hopes, out of the bitter depth of our pain, spring purer thoughts and nobler aims. We take up the burdens of our tasks again, and tread the stony road of life, with lacerated feet and bleeding hearts; but our gaze is lifted to the lighted landscape beyond, and the voices of our beloved dead are ever bidding us 'be patient!'

Side by side with the highway of life, but far removed from the dust and turmoil of the road, lies the Country Churchyard. The spring flowers bloom early above the dead; the summer sun looks down upon the grassy mounds, and tinges the tombs at eventide with its 'parting gleam,' the autumn leaves fall thick upon them; the winter* folds its white wings over them. So the seasons come and go, and they make no sign. The strife and the battle are not for them.

Daily the tides of life go ebbing and flowing beside them. Thousands of throbbing hearts, where theirs are at rest and for ever,

Thousands of aching brains, where theirs no longer are busy,

Thousands of toiling hands, where theirs have ceased from their labours,

Thousands of weary feet, where theirs have completed their journey.

A DEAD RECKONING.

CHAPTER XL.

No one spoke for a moment or two after Margery had blurted out her news. Then for the second time Karovsky said: 'There is still one way of escape open to you.'

'And that is?'—said Gerald again.

'For me to personate you.'

'O monsieur!' cried Clara, a flash of hope leaping suddenly into her eyes.

'Karovsky, are you mad?'

'Pardon; I think not; but one can never be quite sure. Listen! These men who are coming to arrest you are strangers to you, or rather, you are a stranger to them; they have never set eyes on you before. I will answer to your name; I will go with them; and before they have time to discover their mistake, you will be far away.'

'And the consequences to yourself?'

'A few hours' detention—nothing more. Your English police know me not.' Then he added with a shrug 'At St Petersburg or Berlin, no for, it might be somewhat different.'

'Karovsky, your offer is a noble one, and the risk to yourself might be greater than you seem to think. In any case, I cannot accept it.'

'Gerald, for my sake,' implored his wife.

'As I said before, I am tired of this life of perpetual hide and seek. Let it end, I am ready to face the worst.'

'No, no! Would you court a felon's doom, you whose innocence will one day be proved to the world?'

'*Voilà, voilà, raison, malheur,* said the Russian. Then placing his hands on Gerald's shoulders, he said 'Go, Brooke, my friend, hide yourself elsewhere for a little time, and leave me to face these bloodhounds.'

Picot, who had been listening and waiting in the background, now came boldly forward. It was enough for the kind-hearted mountbink to know that his friends were in trouble. 'I have une petite chambre en haut,' he said to Gerald. 'Come with me, monsieur, and I will hide you.'

'Yes, yes, go, dearest, with Monsieur Picot,' urged his wife, her beautiful eyes charged with anguished intensity.

'For your sake, let it be as you wish,' answered Gerald sully.

At this juncture there came a loud knocking at some door below stairs.

'Venez, monsieur—vite, vite!' said Picot.

Gerald hastily kissed his wife, snatched the Russian's hand for a moment, and then followed the mountbink.

'It will not be wise to keep our friends waiting,' said Karovsky. Then turning to Miss Primby, 'Madame, will you oblige me by taking charge of these trifles for a little while?' With that he handed her a card case, a pocket book stuffed with papers, and a bunch of keys.

'They will be mighty clever if they get them out of here,' muttered Miss Primby, as the articles disappeared in the capacious depths of some hidden pocket.

The knocking was repeated in louder and more imperative terms than before.

'Let the door be opened,' said Karovsky to Margery, then he addressed a few words hurriedly in a low tone to Miss Brooke.

The door at the foot of the stairs, which Margery in her alarm had taken the precaution to fasten, had apparently been originally put there with the view of more effectually separating the upper part of the house from the lower, probably at a time when the domicile was divided between two families. This door Margery now unbolted without a word, and without a word, after flashing a bull's eye in her face, a sergeant of police and two men pushed past her and tramped heavily up stairs.

'Mr Gerald Brooke, commonly known by the name of Stewart?' said the sergeant interrogatively as he advanced into the room, while his two men took up positions close to the door.

The Russian turned—he had been in the act of lighting a cigarette at the fireplace. 'Who are you, sir, and by what right do you intrude into this apartment?' he demanded haughtily.

The sergeant went a step or two nearer and laying a hand on his shoulder, said 'Gerald Brooke, you are charged on a warrant with the wilful murder of the Baron Otto von Rosenberg on the 28th of June last at Beaulieu, near King's Harold, and you will have to consider yourself as my prisoner.'

The Russian dropped his cigarette. 'There is some strange mistake,' he said. 'I never either saw or spoke to the Baron von Rosenberg on the 28th of last June.'

'All right, sir, you can explain about that somewhere else, but I should advise you to say as little as possible just now.'

One of the men had advanced into the room, and now drew the officer's attention. 'I say, sergeant,' he whispered, 'the gent don't seem to answer much to the printed description, does he?'

'Idiot!' whispered back the other, 'as if a man couldn't dye his hair and make his beard and moustache grow any shape he liked! Besides, we knew beforehand that he was disguised, and this is the room where we were told we should find him.'

When the sergeant turned again, Clara was standing before Karovsky with a hand resting on each of his shoulders.

'You see,' whispered the sergeant to his subordinate. 'We were told his wife was living here with him, as well as an elderly lady, the aunt. He's the gent we want, and no mistake.'

'I shall only be away for a little while, mamma,' said Karovsky, as he drew Clara to him for a moment her head rested against his shoulder, then his lips lightly touched her forehead.

She turned from him, and sinking on a couch, buried her face in her hands.

Karovsky drew himself up to his full height. 'Now, sir, I am at your service,' he said to the sergeant.

A moment later, and the three women were left alone.

'They be clever uns, they be!' said Margery with a chuckle as the sound of the retreating footsteps died away.

'How noble, how magnanimous of Monsieur Karovsky!' exclaimed Miss Primby. 'I shall never think ill of the Russians again.'

'Now is the opportunity for Gerald to get away,' said Clara. 'The police may discover their mistake at any moment.' Her hand was on the door, when suddenly there was a sound which caused all three to start and stare at each other with eyes full of terror. It was the sound of unfamiliar footsteps ascending the stairs. Mrs Brooke shrank back as the door opened and George Crotton entered the room. 'You!' she gasped.

'Even so,' he answered as he glanced round the room. 'It is long since we met last.'

'Not since the day you crushed my husband's portrait under your heel.'

'As I have now crushed your husband himself.'

'What do you mean?'

'Clara Brooke, the hour of my revenge has struck. You slighted me once, but now my turn has come. It was through my efforts that your husband was tracked to this place. It was I who

gave information to the police. Never could there be a sweeter revenge than mine.'

'Can such wickedness exist unsmitten by Heaven!'

After that first glance round, he had never taken his eyes from Clara's blanched face. He spoke with a venomous intensity which lent to every word an added sting.

'Don't I just wish I was a man, instead of a great hulking good-for-nothing girl!' muttered Margery, half to Miss Primby and half to herself, as she defiantly rolled up the sleeves of her cotton gown.

For a little space, the two stood gazing at each other in silence.

Clara's heart beat painfully, but her eyes blazed into his full of scorn and defiance. Then she said: 'George Crofton, believe me or not, but my husband is as innocent of the crime laid to his charge as I am. It is not he who is a murderer, but you who are one after this night's work—in heart if not in deed.'

A sneering laugh broke from his lips. 'I was quite prepared to hear that rigmarole,' he said. 'It was only to be expected that you should swear to his innocence. It is possible you may believe in it—wives will believe anything.'

But Clara's ears, of late ever on the alert, had heard a certain sound. With a low cry she sprang to the door; but before she could reach it, it was opened from without, and Gerald, accompanied by Picot, appeared on the threshold.

Crofton felt back as if he had seen a face from the tomb. 'By what fiend's trick have I been fooled?' he cried.

'There stands the villain who betrayed you,' exclaimed the young wife, pointing to Crofton with outstretched finger.

'He! My cousin! Impossible.'

'It may not be too late yet,' exclaimed Crofton as he sprang to one of the windows and tore aside the curtain. But next instant, with a bound like that of a tiger, Picot had flung himself on him and had gripped his neck as in a vice with both his sinewy hands. The other was no match in point of strength for the mountebank; and before he knew what had happened he found himself on his back on the floor, half-choked, with Picot kneeling on his chest and regarding him with a sardonic grin.

Clara, with a natural impulse, had clung to her husband's arm. Miss Primby and Margery were too startled to utter a word.

Picot's hand went to some inner pocket and drew from it a small revolver; then rising to his feet, he said to Crofton: 'Oblige me by standing up, monsieur, and by taking a seat in that chair, or in one little minute you are a dead man.'

Crofton, with a snarl like that of some half-cowed wild animal, did as he was bidden.

Gerald stepped quickly forward and laid a hand on Picot's arm. 'What would you do?' he asked.

'Shoot him like the dog he is, if he move but one finger. If he move not—tie him up—gag him—and leave him here till you, monsieur, have time to get away.'

Then addressing himself to Margery, but without taking his eyes for an instant off Crofton, he said: 'My good Margot, in my room up-stairs

you will find one piece of rope. Bring him here. Dépêchez-vous—quick.'

Margery needed no second bidding.

Then the mountebank said to Gerald: 'You must not stop here any longer, monsieur; the police may come back at any moment.'

'Yes—come, come,' urged Clara. 'Another minute, and it may be too late.'

'George, I did not deserve this at your hands,' said Gerald with grave sadness to his cousin. The only answer was a scowl and an execration muttered between his teeth.

Gerald, his wife, and Miss Primby retired into the farther room and closed the folding-doors. Margery was back by this time, carrying a small coil of rope.

'Good child.—Now hold this—so,' said Picot, as he placed the revolver in Margery's hand and stationed her about a couple of yards from Crofton. 'If you see that man stir from his chair, press your finger against this little thing, and—pouf—he will never stir again. Hold him steady—so. You have no fear—hein?'

'Why, o' course not,' laughed Margery. 'It would do me good to shoot the likes o' him.'

With a dexterity that seemed as if it might have been derived from long practice, Picot now proceeded to bind Crofton securely in his chair.

'You scoundrel! you shall suffer for this,' muttered the latter between his teeth.

'A la bonne heure, monsieur,' responded the mountebank airily. Then perceiving a corner of a handkerchief protruding from his pocket, he drew it forth, and tearing a narrow strip off it, he proceeded to firmly bind the other's wrists; then making a bandage of the remainder, he covered his mouth with it and tied it in a double knot at the back of his neck. 'Ah, ha! that do the trick,' he laughed. 'How found you yourself? Very comfortable—hein?'

Margery, who had watched the operation with great glee, now gave back the revolver and retired to the inner room. Picot sat down a little way from his prisoner, but for the present took no further notice of him. He had heard a footstep on the stairs a minute or two previously, and rightly judged that Gerald was already gone.

From the first day of taking up their abode at No. 5 Pym's Buildings, Clara and her husband had prepared themselves for an emergency like the present one. They were always ready for immediate flight, and had arranged the means for communication in case of an enforced separation.

At the end of a few minutes Margery returned, carrying a folded paper, which she gave to Picot, at the same time whispering a few hurried words in his ear. The mountebank nodded and smiled and kissed the tips of his fingers. Then the girl went back, and the two men were left alone. But presently both of them heard the footsteps of more persons than one descending the stairs. Picot listened intently till the sound had died away, and then proceeded to light a cigarette. Of Crofton, sitting there bound and gagged, he took not the slightest apparent notice.

A quarter of an hour passed thus, and with the exception of a footfall now and then in the court below no sound broke the silence. At the end of that time, Picot's cigarette being finished, he rose, pushed back his chair, clapped his hat on

his head, and after a last examination of his prisoner's bonds, he marched out of the room without a word, and so down-stairs and out of the house, first shutting behind him the door which divided the upper rooms from the ground floor.

Left alone, George Crofton began at once to struggle desperately to free himself, but all to no purpose. After a little time, however, he discovered that the chair in which he was bound moved on casters, and this discovery put an idea into his head such as would not have entered it under other circumstances. The room was lighted by a lamp on a low table, and to this table he managed by degrees to slide his chair along the floor. Then setting his teeth hard, and stretching his arms to the fullest extent his bonds would allow of his doing, he held his wrists over the flame of the lamp, and kept them there unflinchingly till the outermost coil of the ligature which bound them was burnt through. When once his hands were at liberty, very few minutes sufficed to make him a free man.

'My revenge is yet to come, Gerald Brooke,' he said aloud as he paused at the door and took a last glance round. 'It is but delayed for a little while, and every day's delay will serve but to make it sweeter at the last.'

CHAPTER XII.

We are back once more at Linden Villa. It is a March evening, and the clock has just struck nine. George Crofton is smoking a cigar, and gazing fixedly into the fire, seeing pictures in the glowing embers which are anything but pleasant ones, if one may judge by the lowering expression of his face. He looks haggard and careworn, and is no longer so fastidious with regard to his personal appearance as he used to be. Dissipation has set its unmistakable seal upon him; he has the air of a man who is going slowly but surely downhill.

His wife is amusing herself somewhat listlessly at the piano. There is a slightly worn look about her eyes, and the line of her lips looks thinner and more hard set than it was wont to do. Married life had not brought Stephanie the happiness, or even the content, she had looked forward to. The awakening had come soon, and had not been a pleasant one. Not long had it taken her to discover that she had mated herself with an inveterate gambler, if not with something worse. So long as plump young pigeons were to be had for the plucking, matters had gone on swimmingly at Linden Villa. There had been no lack of money, and Stephanie had never cared to inquire too curiously how it had been come by. But after a time Crofton's wonderful luck at cards began to be commented upon; people began to be shy of playing at the same table with him; pigeons were warned to avoid him; and when, one unfortunate evening, he was detected cheating at the club, and unmasked by a member cleverer in that particular line than himself, his career in that sphere of life came to an end for ever. But his ambition had not been satisfied with the comparatively small gains of the card-table; he had bet heavily on the St Leger and other races, and had been unfortunate in all. So far he had been able to meet his racing liabilities, but the doing so had exhausted the whole of his available resources, and matters at

Linden Villa had now come to a pass that might almost be termed desperate.

Stephanie brought her roudades to an end with a grand crash; then turning half round she said in her clear metallic tones: 'Have you anything to talk about, mon ange? Have you nothing to say to me?' Her husband's back was towards her as he sat brooding sullenly in front of the fire. 'It is not often that you stay at home of an evening, and when you do—chut! I might as well be alone.'

He shrugged his shoulders. 'What would you have me talk about? Our debts—our difficulties—our'—

'Why not?' she broke in quickly. 'If you talked about them a little oftener, it might be all the better. You seem neither to know nor care anything about them. You are out from morning till night. It is I who have to promise, to cajole, to lie, first to one person and then to another who come here demanding money when I have none to give them. Oh, it is a charming life—mine! N'importe. It will end itself in a little while.'

'What do you mean? What new trick are you hatching now?' he demanded.

'It is nothing new—it has been in my head for a long time. Shall I tell you what it is? Why not?' The fingers of one hand were still resting on the piano. She struck a note or two carelessly, and then went on speaking as quietly as though she were mentioning some trifling detail of everyday life. 'One evening, cheri, when you come home you will not find me; I shall be gone. This life suits me no longer. I will change it all. I will go back to the life I used to love so well. I have had a letter. Signor Ventelli is at Brussels; he prays to me to return to him. I shall go. You and I, my friend, can no longer live together. It will be better for both that we should part.' Again her fingers struck a note or two carelessly.

Crofton was roused at last. He started to his feet with an imprecation and faced his wife. 'What confounded stuff and nonsense you are talking, Steph,' he exclaimed. 'As if I believed a word of it!'

'Do I ever say that I will do a thing when I do not intend doing it?' she quietly asked.—'In his own mind he was obliged to confess that she did not.—'We have made a mistake, you and I, and have found it out in time,' she resumed. 'We can be friends, always friends—why not? But you will go your way, and I mine; that is all.'

The cold indifference of her tone and manner stung him to the quick. Evidently she was minded to cast him off as carelessly as she would an old glove. The sullen fire in his heart blazed up in a moment. He loved this woman after a fashion of his own, and was in nowise inclined to let her go. 'What you say is utter nonsense. I would have you remember that you are my wife, and that I can claim you as such anywhere and everywhere.'

'And do you imagine that if I were twenty times a wife I should allow you or any other man to claim me as such against my will?' demanded Steph with a contemptuous laugh. 'Tza! tza! my friend, you talk like a child.'

They were standing face to face, and for a few moments they stared at each other without speaking; but the clear resolute light that shone out of Steph's eyes cowed, for a time at least, the fitful,

dangerous gleam flickering redly in her husband's bloodshot orbs, as though it were a reflection from some Tophet below.

George Crofton turned away, and crossing to the sideboard, poured himself out a quantity of brandy. 'You would be a fool, Steph, to leave me as you talk of doing, were it only for one thing,' he said dryly. He seemed to have quite recovered his equanimity, and was choosing a cigar as he spoke.

'If it pleases me to be a fool, why not?'

'Has it never occurred to you that any morning the newspapers may tell us that my cousin, Gerald Brooke, has been captured? Every day, that is the first news I look for.'

'Ah, bah! you mock yourself. Your cousin will never be arrested now; he has got safe away to some foreign country long ago.'

'You have no ground for saying that. Any hour may bring the tidings of his capture, and then— But you know already what the result of his conviction would be to you and me. Beechley Towers and six thousand a year—nothing less.'

'You deceive yourself,' resumed Steph. 'You are waiting for what will never happen. Nine months have passed since the murder, and the crime is half forgotten. You let Gerald Brooke slip through your fingers once; but you will never have the chance of doing so again.—Let us come back to realities, to the things we can touch. Dreams never had any charms for me.'

He went back to the fireplace with his cigar, and took up a position on the hearth-rug. 'As you say—let us stick to realities; it may perhaps be the wisest,' he went on. 'What, then, would you think, what would you say, if I were to tell you as a fact that in less than six weeks from to-day I shall be in possession of ten thousand pounds?'

'I should both think and say that it was not a fact, but a dream, a—what do you call it?—a Will-o'-the-wisp.'

'And yet it is not a dream, but a sober solid fact, as a very short time will prove.'

She raised her eyebrows; evidently, she was incredulous. 'You made sure that you would win two thousand pounds at Doncaster, whereas you contrived to lose five hundred! You were just as certain that you would win'—

'What I am referring to now has nothing to do with horseracing,' he broke in impatiently. '—Listen!' he added; and with that he planted himself astride a chair and confronted her, resting his arms on the back of it and puffing occasionally at his cigar as he talked. 'I am about to tell you something which it was my intention not to have spoken about till later on; but it matters little whether you are told now or a month hence.' He moved his chair nearer to her, and when he next spoke it was in a lower voice: 'The young Earl of Leamington, who is enormously rich, is to be married on the 27th of next month. On the 14th of April one of the partners in a certain well-known firm of London jewellers, accompanied by an assistant, will start for the Earl's seat in the north carrying with him jewelry of the value of over twenty thousand pounds, for the purpose of enabling his lordship to select certain presents for his bride.

That box of jewelry will never reach its destination.'

Stephanie was staring at him with wide-open eyes. 'You would not'—she exclaimed, and then she paused.

'Yes, I would, and will,' he answered with a sinister smile. 'I and certain friends of mine have planned to make that box our own. The whole scheme is cut and dried; all the arrangements in connection with the journey are known to us; and so carefully have our plans been worked out, that it is next to impossible that we should fail.'

'And you, George Crofton, my husband, have sunk to this—that you would become a common robber, a thief, a voleur!'

His face darkened ominously, and the gash in his lip looked as large again as it usually did. 'What would you have?' he asked with a snarl. 'My cursed ill-luck has driven me to it. I cannot starve, neither will I.'

For a little while neither spoke.

'I didn't think you would take my news like this, Steph,' he said presently. 'Think of the prize! How is it possible for a man fixed as I am to resist trying to make it his own? One half comes to me because the plan is mine, but of course I can't work without confederates. My share will be worth ten thousand at the very least; and then, hey presto for the New World and a fresh start in life with a clean slate!—What say you, Steph?'

'At present, I say nothing more than I have said already,' she answered coldly. 'I must have time to think.'

MOUNTAIN LIONS AND WOLVES.

THE Mountain Lion of North America is one of the most dangerous of the wild animals which are found in the mountains of the Far West. Although called a lion, yet this animal bears no resemblance to the African lion except so far as its fierceness is concerned. It really belongs to the same family as the wild-cat or catamount, but is of much greater size, generally being about as large in body and limb as a full-grown sheep-dog. It is rarely seen in the vicinity of settlements, except driven thither by hunger, when it will attack cattle, sheep, horses, or poultry, and at times human beings. But, as a general thing, if not molested it will not attack human beings; though, if wounded, there is no animal which will make a more desperate fight, regardless of consequences. It cannot be driven off from an attack as long as life lasts; it must be killed to be beaten. Its chief peculiarity is its cry, which the most experienced hunter has at times mistaken for the wail of a child in distress. This feature makes the beast more dangerous, especially if he should establish his lair in the vicinity of a settlement, because, unless a person is an old-timer, he will be deceived by that cry whenever he hears it. It is the most perfect imitation of a child's wail of lament I ever heard, more perfect than the cleverest mimic could utter.

Well do I remember the first time I ever heard it. On a winter's night several years ago, while residing in an isolated place in the foot-hills, I was awakened by that cry. Without a second thought I bounded from my bed with the inten-

tion of finding the lost child. As I was opening the door the cry was repeated; this time it was plain and distinct, and apparently very near to the door. I searched the near vicinity thoroughly, but failed to find any child in distress, and was on the point of returning to my bed, when my attention was called to the fact that the watchdog, one which had never failed to sound an alarm at the approach of any person or animal in the night, had not in this instance barked, nor was he at his accustomed post near the door of the house. But instead, I found him cowering in his kennel, apparently terror-stricken. This to me was inexplicable until the next morning, when I saw the tracks in the snow of the beast's feet, larger than the footprints of any ordinary-sized dog.

At another time I had the opportunity of observing the effect on a horse when ridden near a mountain lion. It was late one night in the autumn. I was riding along a lonely mountain road, and when only about two miles from the town or mining camp, I heard the cry of the mountain lion. My horse at once showed fear and refused to move forward. His trembling was so intense that he fairly shook me in the saddle. To whip and spur he paid no attention. Indeed, it was only by the strongest effort that I could prevent him from turning and bolting in the direction we had come from. A crashing in the brush a short distance in advance of me increased the horse's fear and restiveness to such an extent as almost to unhorse me. We both knew full well what that crashing meant; but I also was well satisfied that the beast would not trouble us, because I knew that only a short distance across the hill was a slaughter-house, whither I judged the terror of the mountains was journeying. Although quite a cold night, I found my horse sweating as freely because of its fright as if I had ridden on a dead run for miles.

Another experience, and involuntary meeting with a mountain lion which I had one night when afoot, proved to me conclusively that although dangerous when wounded, it would not attack a man as a rule if not provoked. I was walking along an unfrequented mountain trail about ten o'clock when I heard the lion's cry in the woods not far from me. To say that I was nervous does not express my feelings, for I was scared, the more so because I happened to be entirely unarmed. For the first time for years I had lent my trusty revolver, which by day always rested in its scabbard on my right hip, and by night was carefully placed under my pillow. But there was no help for me; the road I was travelling led home, and although the cry sounded in advance of me, yet I would rather walk on and run my chances with the lion, than retrace my steps, and hear the jeers and scoffs of my late companions at what they and myself would consider an act of cowardice. Besides, the thought that his majesty might not be going to cross my path at all was quite consoling.

All doubt, however, on this subject was removed when the moon came out from behind a cloud, and almost at the same instant the lion sprang into the road from the brush not more than fifteen feet in front of me. Then all the stories I had heard about its ability to cover forty-five feet in one spring down an inclined plane, and

twenty-five feet on a level, flashed through my mind as I stood rooted to the spot with my eyes riveted on those of the intruder. Talk about balls of living fire! Why, I thought that lion's eyes looked as large as two suns on a midsummer day and equally as brilliant. It was only for a minute at most; but it seemed an hour before he turned in a very dignified manner and trotted up the side-hill.

The largest mountain lion I ever saw was one killed by a hunter in the Black Hills, which measured seven feet from tip of nose to tip of tail, or over five feet and a half from tip of nose to root of tail. Miners and hunters fear meeting a grizzly or cinnamon bear less than the mountain lion, because of the latter's ability to spring such a long distance, and to climb trees as quickly as a cat. Its jaws are very strong, and set with very sharp teeth; while its feet are armed with claws stronger, longer, and sharper than those possessed by any animal except it be the tiger or panther.

Another animal seen on the western prairies which has a peculiarity in its cry, howl, or bark, whichever you like to call it, for it resembles all at once, is the cayote wolf. This animal is the direct opposite to the mountain lion in all its characteristics except its partiality for poultry. Neither is it possessed of any of the savage qualities of the timber or gray wolf. It is really more like a fox both in nature and appearance and size, but gets its name of wolf because of the peculiar noise it makes. One of these animals when howling at night makes such a racket that a 'tenderfoot' would be convinced there were a thousand of them round. When hungry, they will sneak into a camp at night and steal bacon or boots, bridles, or anything made of leather. But the least movement will scare them away; they won't even make a fight with a dog.

On the plains and mountains we find three distinct varieties of wolves. First, the little cowardly cayote; next, the gray prairie wolf; and last, the brown gaunt timber wolf. The two last varieties have been known in exceptional cases, when in large packs, to attack people; but usually they are content with committing depredations on sheep-folds and chicken roosts. In 1870, on the prairies in Western Kansas, I knew of cases where the gray wolves had followed calves and yearlings, and by jumping on their haunches and cutting the muscles of their hind-legs with their sharp fangs, dragged them down and killed many young stock-cattle. Every cowboy when in winter-quarters will be found provided with a good supply of strychnine; and when they find the carcass of a calf or other creature killed by wolves, they poison the meat; and on the next night, when the pack come to finish their feast, many of them fall as prey to the cowboy's poison, and their bodies being found on the morrow, are skinned. The hides of the gray and timber wolves are valuable, but those of the cayote are almost worthless.

Nearly all the States and Territories pay a reward for killing wolves; and many hunters in years gone by used to live on the buffalo and cattle ranches all winter through, and give their entire attention to killing wolves for the bounty and value of their hides. The larger varieties will when wounded fight hard, and often fight dogs that pursue them, to the sorrow of

the dogs and their owners, for almost invariably they are killed because of the intense strength in the wolf's jaws and extreme length of their fangs. In fighting, these wolves do not show any of the tenacity possessed by bulldogs, their method being a series of quick snaps as they attempt to escape from their pursuers. Rarely are wolves seen in the daytime, except the coyote; but the traveller will see many of these as he rides over the Western prairies. Wolves used to be found at night following in the trail of any buffalo that may have been mortally wounded by the hunters. When he drops to the ground, they attack the body and gorge themselves; returning to the feast every night as long as any meat is left on the bones of the carcase, or until they fall prey to poison.

A LEGAL SECRET.

CHAP. II.—DREAMERS.

TOOK'S COURT, Chancery Lane, has not a very sunny outlook even on the brightest of days; it is shut in on all sides, except at the narrow entrance, by tall antique houses, with dusty shelves over their doorways and dusty stone steps below. The open window-shutters, begrimed with many coatings of London smoke, are fastened by rusty hooks against the walls. A dull wintry patch of sky hangs overhead; and from there a twilight falls upon hurrying figures—with their echoing footsteps and flitting shadows—passing in and out of this old courtyard. When the evening becomes still more gloomy, and the patch of sky is a mere patch of black, a dismal street lamp in the centre of the Court throws a glimmer through its dusty panes upon the houses on each side; and where the blinds are not yet drawn, and there is no stronger light to oppose it, this modest gleam enters a room quite boldly. There is one room in particular, in which a young girl is seated over a cheerless fire, where this ghost of a light looks in; and it only seems to add to the cheerless surroundings. For the room is small, dingy, and threadbare in appearance. The carpet is worn in places almost to the boards; and there are splashes of ink on the floor, and even on the walls, as if a shower of writing-fluid had recently fallen.

Although simply dressed in a dark serge, the girl appears out of place in the midst of such obvious poverty. There is little in her look and manner to suggest contentment, or even submission. The knitted brow, the curl of the pretty lips, the expressive pressure of the fingers against the dark hair, indicate a self-willed and sensitive nature; and so absorbed is she in her own thoughts, that neither the sound of a peculiar step in the courtyard, nor even the rattling of a latchkey in the door, attracts her attention. It is only when a lean shabby-looking man with a wizened face comes in that the girl starts and glances up. She tries bravely to hide her dejection with a little laugh as she holds out her hand to welcome him to a place beside her on the hearth.

'Dreaming again, Rosa?'—and while speaking, the man sat down before the fire and began to

warm his hands. 'Dreaming again?' His tone, although reproachful, was not wanting in affection.

'I was wondering,' said she, while stroking a large black cat on the hearthrug at her feet, 'whether the impressions of my childhood—the time seems so distant—could be mere fancy? How old was I, dad, when you first took me in?'

The man regarded Rosa thoughtfully. 'How old? Between five and six.—But I can't fix a date, my dear,' he added; 'that's impossible. Your birthday, you know, wasn't spoken of.' Pausing a moment to tap a little wooden box, he extracted a pinch of snuff and then resumed, as though speaking to himself: 'No; he was a reticent party, he was'—and he shook his head at the recollection—'a very reticent party indeed.'

'Twelve years ago,' said Rosa—'twelve years to-day?'

'This very day. Twelve years this afternoon, my dear, since he left you under our care. And that's why,' he added, 'we call this your birthday.'

And now, as he shifted his seat to the table and leant over a portable desk with his back to the window, it became apparent that he and this little parlour must have grown inky and threadbare together. The man's face was sallow and creased like parchment that has been kept in the dusty corner of a lawyer's office for years; and his scanty hair was of a gray dingy colour that might have belonged to a dusty corner too. And yet the man's appearance could scarcely have failed to awaken sympathy. It was kindly in expression, and there was something irresistibly pathetic in the gray watery eyes.

'Then I am seventeen to-day,' said the girl—'or am I eighteen? I think I must be eighteen, dad,' she went on in a thoughtful mood, 'for some of my dreams, as you call them, seem like reality.—What was the gentleman like?'

'The party was keen-featured.' Then he added musingly: 'I should know him again among a thousand.'

'He never told you my name?'

'Why, no. You told us that,' said the man. 'Mother asked you as soon as he was gone. "Rosa," says you.—But as to your surname, we never could make that out.'

'Ah! If we only knew my name,' said the girl in a low voice, 'you would have found out long ago whether the home which I have so often told you about was really mine; and whether that beautiful face—a face bending over my pillow at night—was the face of my own mother. It sometimes seems to me as if it must have been true,' she added, with a look of discontent returning to her face. 'Is it not a shame, if my parents are rich, that I should live in such poverty as this?'

The old man looked troubled. He took a quill pen from behind his ear and began to stroke his chin agitatedly, and looked at the girl and then at his desk. 'Rosa,' said he, presently breaking the silence, 'what is the use, my dear, of thinking so much about the past? It leads to no good; it only makes one wretched.—Not that I've any right to expect,' he added in an almost humble tone, that removed any suspicion of irony,

'that a young lady born in the lap of luxury—if I may so express myself—could easily lead herself to take a much brighter view of *this* life. Before we came to town—before mother died—there were fields to run about in, and you were younger. But there's a bit of garden in New Square, just across Chancery Lane; and there's Lincoln's Inn Fields hard by; and when one listens to the sparrows, though it ain't much of a song, it makes one fancy, as the birds must do, that the spring ain't very far off now.'

The brightening hopeful look on the careworn features which accompanied these words brought a smile to Rosa's lips. She left her seat and went and laid her hand tenderly on the man's shoulder. 'Daddy,' said she with a repentant look, 'I will try to be more reasonable; I will try to think less about my sunny childhood. I always get dreaming more on my birthday, as we call it, than at any other time. Don't I?'

The man nodded and smiled.

'But, daddy, I was not thinking altogether about myself,' she went on, 'though I know I'm very selfish; I was thinking, if I could find my beautiful mother, that I could tell her what a father you had been to me; and she would make you rich and happy.'

'Would she? Ah, my dear,' said the man, shaking his head incredulously, 'you don't know the world.—But I'm forgetting,' he suddenly added, with a glance towards the window. 'I'm expecting a visitor; he may be here at any moment!'

'A visitor?'

'I've been calling, as I was advised, at Pilkington's,' the man explained, 'and'—

'Pilkington?' She spoke scarcely above a whisper. 'How that name reminds me of my old home.'

'And,' the man continued, scarcely heeding the interruption, 'the junior partner, Mr Trench, being too busy to see me, sent out a message to say that as soon as he was disengaged he would step over and have a talk about the work. There's a vacancy in the office; and it looks very much as if I should get the post.'

This was good news. For the last few weeks the poor clerk had been out of employment, and his slender savings were exhausted. He had confessed to Rosa only yesterday that the last shilling had been changed, and that unless he got work they would have to face a serious situation. But he did not lose heart: he assured her that it was better to laugh over their trouble—even though it might mean starvation—than break down in tears as she had done.

Rosa thought of his words now, as she stood at the window and looked out into the dismal Court; and while she still stood there, she heard a quick step below, and saw a young man with a frank handsome face stop at their door and raise the knocker. She could see him glancing up at her by the street lamp.

Sidney Trench—for it was he—having knocked at the old house in Took's Court, again glanced towards the window; and the glimpse he gained of the girl by the dim light thrown upon her set him wondering. Where had he seen that pretty dark face before? Next moment the door opened and the dark face was looking up inquiringly at him. And now, so familiar did her

whole appearance seem to Sidney, that he could scarcely suppress a smile of recognition. Where had they met, and when? These questions rose to his lips; but he could not give them utterance. He could only look at the girl in silent wonder and admiration. It was like a dream-scene that had flashed through his brain only to vex and bewilder him.

'Do you wish to see Mr Norris?'

Her voice scarcely recalled him; for it puzzled him, too, little less than the face.

'Yes. Does he live here?'

She led the way into the parlour. 'He will be with you directly.—Are you Mr Trench?'

He was standing with his back towards the window. The girl lingered at the door, and was glancing at him with modest curiosity. Was it his fancy, or was there a look of recognition in her eyes too? He hastened to answer her.

'My name is Trench—Sidney Trench. Have I the pleasure to address Miss Norris?'

She hesitated a moment before answering; then she looked up into his face and said: 'My name is Rosa.'

An exclamation nearly escaped him. But at this moment the old clerk came in with a light. It was an antique reading-lamp, of which the glass was broken.

Rosa went out, and Abel Norris closed the door.

'Pray, be seated, sir,' and Sidney sat down by the fireside where the girl had been dreaming not many minutes before.

Norris placed himself at his desk; he was more at his ease in that position. Taking the quill from his ear, he dipped it in the ink with some show of energy, such is the force of habit; then he waited for Sidney to speak.

'You have had some years' experience,' the young man suggested, 'in a lawyer's office?'

'Fifty, sir: fifty years, and one or two to spare.'

Sidney scrutinised the clerk's face. 'In London?'

'At St Albans,' said Norris, 'for over forty years. Since then, we've been wandering here and there; for when mother died'—

'Your wife?'

'That's what I should say—my wife. For when she died,' he resumed, 'we thought we would seek our fortune, so to speak. We have met with nothing but misfortune.'

'I'm sorry to hear that,' said Sidney sympathetically; 'and I hope your fortune will now mend.'

For a moment the young lawyer looked thoughtful. He then resumed: 'All that I have heard about you,' said he, 'makes me anxious, if I can, to serve you. And I would offer you without hesitation a place in our office; but I find it impossible to do so.' Sidney Trench, without turning his head, glanced towards the old clerk; for he heard the pen drop from the man's fingers. He now observed that he was pressing his hands to his head in a despairing attitude.

There was a lengthy pause. Sidney felt that, after his conversation with Mr Pilkington, he would be acting decidedly in opposition to his wishes if he engaged this clerk. How, then, could he serve one who appeared so deserving? He had roused his interest; and was he not also interested in the dark eyes that had looked up into his face when he came in? The young lawyer

turned to the clerk. 'Mr Norris,' said he, 'I have something to propose. Although I cannot promise, at least not at once, a situation in our office, there is no reason why you should not work here. I want some deeds and other documents copied. Will you undertake to do this for me?'

Norris briskly picked up his pen. 'Here, sir, at my desk? It is the method I should prefer.'

'Is it? Then you shall begin,' said Sidney, 'to-morrow morning.—Meanwhile,' added the young man, taking a cheque from his pocket, 'put this in your desk.'

The old clerk could not speak; but his trembling outstretched hand and the tears that sprang to his eyes expressed his gratitude.

'You have no family?' Sidney presently remarked.

'No, sir, none,' said Norris; 'only Rosa.'

Sidney regarded the man keenly. 'The young girl who'—he hesitated slightly—'who let me in?'

'Yes.'

'Ah,' said Sidney, assuming indifference, 'a grandchild, perhaps?'

'An adopted daughter.'—After a moment's silence, he added: 'It's a strange story.'

'Indeed?' and Sidney looked up inquiringly into the old clerk's face.

Norris became thoughtful; and then, in a low voice, as if recalling to mind the incident, rather than addressing Sidney Trench, he said: 'It was one afternoon, a wintry afternoon, just twelve years ago. I was sitting at my desk at St Albans—as it might be now—and happening to glance towards the window, I saw an elderly gentleman coming across the road. The gentleman stopped, and seeing my wife at the front door, spoke to her; and presently they came in together where I was sitting. My wife was holding a child—a little girl—by the hand.' Pausing a moment, with the pensive look still on his face, he then resumed. He had placed his snuff-box on the table, but had not mustered the courage yet, in the presence of his new master, to extract a pinch. 'A prettier child,' said he, 'with her dark eyes and thick black hair, I never saw. I took to her at once—fell in love with her, so to speak, at first sight! The gentleman briefly explained his errand. He was going abroad—he did not say for how long, and wanted a home for the child. He had been recommended to call upon us. Would we undertake the charge of this little girl during his absence? He would pay us liberally.'—

'Can you recall to mind,' interrupted Sidney, 'what this gentleman was like?'

'Yes; I shall never forget that,' replied Norris. 'A stern face, with thick gray eyebrows. I don't remember the eyes, but it was a hard mouth; a hard man, I thought; a reticent man, who seemed to read your character at a glance, and gain your confidence by sheer force of intellect. A more clever face—as I expressed myself to my wife at the time—I never saw.'

'What age did he appear?'

'Between sixty and seventy. And I remember thinking—perhaps because I had to do with the law myself—that he must be a member of the legal profession.' In an absent-minded manner, Norris took a pinch of snuff, and then concluded:

'We accepted the offer, gladly enough, for we were very poor. He placed fifty pounds in bank-notes in my hand; and he wrote down an address in Paris, and promised that we should soon hear from him again. I posted letters to that address, but never received any answer; so at last I ceased writing. We have neither seen nor heard anything of him since.'

Sidney now rose, and stood on the hearth-rug with an earnest look on his face. 'A mysterious affair. Have you no clue?'

'None. I have even lost the address in Paris.'

'How comes it that you call the girl Rosa?'

'Ah! we were just talking about that, sir, before you came. She told us herself that her name was Rosa: and that was all she could tell us, though we questioned her over and over again.'

Sidney Trench, thinking over all that he had learnt from Abel Norris, began to recall to mind in a dreamy way his early boyhood. He had had a playmate in those days—now twelve years ago—and he had named her his little sweetheart. She was a child, he could well remember, with dark serious eyes and a wilful manner. But he had been sent away to a school in Switzerland for three years, and she had gone out of his young life; for when he returned to England she was never spoken of in his presence. But an incident, which had impressed him deeply, had one day occurred. Mr Pilkington had been appointed his guardian by Sidney's father, the late senior partner. It was a grave responsibility. Sidney Trench was very young; and Mr Pilkington, even at that time, was getting on in years; and should he die (this was when Sidney was fourteen), all the legal secrets—as far as Trench, Pilkington, and Trench were concerned—would die with him. To read between the lines of legal documents which lay in deed-boxes in every corner of the old house would be impossible; and the calamity, if it came about, could only be compared to the loss of a bunch of keys which could never be replaced; for the clients would take their secrets elsewhere, and the great firm would dwindle into comparative insignificance. The very thought of such a mishap—as Sidney had been taught to believe in his wondering boyhood—was enough to shorten his guardian's life.

So, one day, in his youthful simplicity, he had ventured to put the question to Mr Pilkington: 'Is my little sweetheart, sir, a legal secret?' For the thought that his guardian might die, and he might never learn what had become of that child, was the subject which troubled him most. But he had no sooner made this inquiry than he wished he had held his peace; for on the following day Mr Pilkington sent him back to school, though the holidays were only half over. He never again had the courage to question his guardian.

This old dread of Mr Pilkington—though so many years had gone by—recurs to Sidney when he goes that evening to join him in the library; for he is but a boy compared to this aged lawyer, and the fear of offending him is strong within him still.

And yet, if he had yearned in his boyhood to know something about that 'little sweetheart,'

he is yearning even more now to solve the mystery of her disappearance.

Mr Pilkington is warming his wrinkled hand over the library fire; he looks at the young man under his thick eyebrows. Can Mr Pilkington have observed—for they had met at dinner an hour or two after Sidney's visit to Took's Court—that Sidney is revolving some problem in his own mind? Something in the old lawyer's manner as he bends and warms his hand suggests an unusual sternness. 'Sidney,' says he, and the voice is stern too—'sit down and listen to me.—At least,' he adds as the young man takes a chair beside the hearth—'listen, if you still look upon me as your guardian; if you are still willing to receive advice.'

'Why should you doubt it, sir?'

Mr Pilkington's brow darkens at the question. 'You are not frank with me,' he replies in an angry tone; 'you are holding something back.'

Sidney does not answer. Why not? His guardian's words are like a direct challenge; and yet he remains silent. The old dread cannot in a moment be overcome.

His silence does not dispel Mr Pilkington's displeasure; it seems to add sensibly to his irritation. 'Be careful, Sidney'—the old lawyer admonishes him, raising his forefinger impressively. 'A secret character—a man who does not confide in his friend—deserves no compassion! I have some acquaintance with such natures; and when you come to know all our clients' secrets—and you soon will now—you may learn that troubles arise out of this very fault—secrecy. Profit by experience—*my* experience. That is my advice to you.'

Sidney now essays to reply. Mr Pilkington stops him: 'Another time; I am in no mood to listen now.'

Sidney, more perplexed than ever at his old guardian's attitude, turns away; and the lawyer, still warming his hand over the fire, looks after him with keenness as he goes out.

'THE NOTES THAT PEOPLE THE SUNBEAM.'

OUR knowledge in no department of science has made greater strides during the last few years than in that of Bacteriology. The existence of organisms far smaller than anything that the naked eye can discern was a fact little suspected until comparatively recent times; and ever since the microscope first revealed to our eyes the world of 'the infinitely little,' as it has been felicitously called, our knowledge of these microscopic forms of life has gone on increasing. Indeed, we have every reason to believe that we are now at the threshold, so to speak, of another and vaster world of even still more minute organisms, smaller far than even anything our most powerful microscopes are capable of revealing; about which, it is true, we as yet know little, but which we cannot doubt play a most important part in the economy of nature.

These micro-organisms exist in the atmosphere and in water; but it is only within the last few years that we have had any means of

arriving at an approximate idea of the extent to which they are present in these media. It is in the first instance to the brilliant investigations of M. Pasteur that we owe our knowledge on this point; and the important experiments he was the first to carry out have been developed and extended by others. Pasteur showed that with regard to the presence of these micro-organisms in the atmosphere, the higher the altitude reached and the greater the distance from human habitations, the purer was the air. These investigations, so brilliantly begun by the great French chemist, have been carried on by chemists and physiologists both in this country and on the Continent. Professor Tyndall has shown that in calm air a rapid subsidence of these microbes takes place. The distinguished German physiologist Dr Koch has devised a method by means of which we are enabled to form an estimate of the number of these micro-organisms present in a measured quantity of either water or air. The method consists in cultivating the germs in a solid medium (gelatine is most commonly used). Each organism thus grows and multiplies on the spot where it is planted, as it is prevented from moving. The progeny of each micro-organism in this way gather round the parental home, and we have in the course of a short time, instead of the single organism, a large colony. All that is required, therefore, in order to test air or water for micro-organisms is to introduce a definite measured quantity of either air or water into the cultivating medium, and, after allowing a sufficient period of time to elapse, to count the number of colonies visible.

Some interesting experiments were made on this point a short time ago by Dr P. F. Frankland. The air was tested at different places and under different circumstances. It was found that the number of organisms present in the atmosphere differed at different seasons of the year, the largest proportion being found during the summer months. In a certain volume of air (two gallons) collected on the top of the Science and Art Department buildings at South Kensington, one hundred and five of these micro-organisms were found to be present. This was in the month of August. Indoors, of course the number is very much greater. Thus, in a similar quantity of air collected at the rooms of the Royal Society during a conversation, no fewer than four hundred and thirty-two were found to be present; while another experiment showed that from the air of a third-class railway carriage containing ten people no fewer than three thousand one hundred and twenty microbes fell per minute on a square foot.

So much for the living organisms in our atmosphere; now for a word or two on the dead inorganic particles in the air. These are infinitely more numerous than the living germs; and an extremely ingenious method has recently been devised by Mr John Aitken, F.R.S.E., for the purpose of estimating their number. Like the organic germs, they are infinitely minute in size, most of them being altogether undetected by the most powerful microscope. It was necessary, therefore, to have recourse to some method of making them visible. The plan adopted was

as follows: The air to be tested was admitted into a large glass vessel, where it was saturated with water-vapour; then supersaturated by slightly expanding it by means of an air-pump. The result was a fog; and as it is known that a fog is caused by these dust-particles becoming surrounded by a watery envelope, the number of fog-particles shows the number of dust-particles. The counting of these fog-particles was effected in the following way: A very small portion of the air to be tested was mixed with a large quantity of air which had been rendered absolutely pure by filtering it through cotton-wool. The mixture was then admitted into a large glass receiver and saturated as above described. As the dust-particles were so few, instead of a fog a small miniature rain was formed, and the number of these small raindrops falling on a small silver mirror was counted, and, by a simple calculation, the amount in the quantity of air originally admitted thus estimated. The following are some results obtained: It was found that the air outside during rain contained per cubic inch 521,000 dust-particles; that during fair weather the number present was more than four times that amount; while inside a room near the ceiling 88,346,000 were counted. The dust-particles seem, however, to be most numerous near a gas flame, for it was found that in a cubic inch of air taken from the immediate vicinity of a Bunsen flame, the colossal number of 489,000,000 were present. In Mr Aitken's own words: 'It does seem strange that there may be as many dust-particles in one cubic inch of the air of a room at night when the gas is burning as there are inhabitants of Great Britain; and that in three cubic inches of the gases from a Bunsen flame there are as many particles as there are inhabitants in the world.'

OLD QUIN'S BANK.

ONE morning I was walking along the shore. The tide was ebbing, being already lower than I remembered it, leaving a broad stretch of glistening sand exposed. Projecting above the surface of the water were some timbers, and where they were left high and dry, curiosity led me to inspect them. The beams were evidently very old; but being deeply embedded, I could not tell if they were part of some sunken vessel or the remains of a jetty. Poking among the pebbles that were washed between them, I came to a cavity containing something round, which could be moved, but was too large to be easily withdrawn. Setting to work with a piece of wood, I succeeded in clearing away the seaweed and stones which blocked up the hole, and at length dragged out a small barrel, strongly hooped with iron, and encrusted with limpet and mussel shells. I carried the barrel to the beach, and seating myself in a cave, proceeded to examine it. Forcing in one end with a heavy flint, I drew out an oil-skin bag—all the barrel contained. Inside was a piece of soiled paper, on which the following words were scrawled in faded ink: 'We are driving on to the rocks with our ruyder washed away. I,

Thomas Quin, do commit this to the sea. Let whoever finds it take it to my daughter Dorothy at Shingle Bay. No time for more.' On the other side of the paper was a rough drawing, of which at first I could make nothing.

This Thomas Quin was one of the bygone heroes of whom the fishermen in my part of the coast were never tired of spinning yarns. Quin had been very successful in his ventures; but on his last voyage home from France with a valuable cargo, his vessel must have foundered in a terrible storm, for nothing had since been heard of him. This happened more than thirty years before. His wife, who was a cousin of my mother, had died in giving birth to Dorothy; and the little girl, of whom Quin was passionately fond, was thus left alone in the world. She, however, was taken care of by some good friends in the village, who brought her up; and in course of time she was married to a young farmer, with whom things did not prosper, and who came to an early death. Dorothy Hendil was again left in an almost destitute condition, having now to support a little daughter. While in these straits, relief came in an unexpected manner. One evening, a weather-beaten old sailor trudged into the village, and making straight for the cottage, burst in on Dorothy and threw his whole stock of money into her lap. The neighbours crowded round; and it at once became known that her only brother Ben, who had long been given up as dead, had returned. After that there was no more want, for Ben was in receipt of a pension; and buying a small boat, he added to his income by fishing. My greatest delight was to visit my cousins and to go out with Ben in his little craft. I was almost as often at Shingle Bay as at home, and thus little Dorothy and I grew up together, and learnt to regard each other with more than cousinly affection. But I never mentioned the subject to my father, as I knew he would not allow me to marry a penniless girl.

These thoughts filled my mind as I sat puzzling away at the drawing in my hand, and raised the hope that perhaps Quin—who, though known to be well off, had left no account of any savings—might have hidden away his money, and the paper might contain the clue to finding it. Hiding the barrel in a crevice of the cave, I made my way to my cousin's house.

Shingle Bay, for which I was bound, was a deep inlet, shut in with high cliffs; the village consisting of one straggling street, built on the narrow strip of ground at the foot of the hill. A rough stone quay ran out into the sea for the unloading of small vessels, which occasionally put in here, and protected the outlet of a little stream that ran plashing down from a deep glen. As I went down the steep path I saw Ben Quin in his boat busy overhauling some fishing-tackle. On hearing my footsteps, he looked up and cried in a lusty voice: 'Well, I'm downright glad to see you, George! I'm going to hansel these new lines this morning. We'll go up to the Cottage and have a bit of something to eat before we start.'

Ben was a short thickset man, with a square good-humoured face, the colour of mahogany; and although getting on in years, was pretty well as sturdy as ever. We walked up the village, and soon came to the little thatched cottage, and enter-

ing its creeper-covered porch, were warmly greeted by Mrs Hendil and Dorothy.

I told the story of finding the paper, and they all crowded round me as I took it out; Dorothy leaning over my shoulder in her eagerness, read it aloud. Her mother was greatly affected on hearing this last message from the sea, while Ben had to clear his throat a good many times before he could recover his composure.

When they had got over the excitement, I asked them if they could make anything of the rough drawing on the back of the paper; but after carefully examining it, they came to the conclusion it was some old chart which had been used in the hurry of the moment. It represented an irregular oval, with the cardinal points marked, in the south-east part of which was a curious arrangement of five circles, the middle one being larger than the others. We sat discussing the discovery, speculating on the strange event so long that the fishing expedition was quite put on one side.

'I well remember,' said Mrs Hendil, 'that on the night in which father went on his last voyage, he promised me he would give up the sea when he came back. "I'm getting too old for the work, Dolly," he said, as I sat on his knee before going to bed; "and besides, it's a risky business. If this run is successful, I've made up my mind to retire from the trade altogether. Anyway, I've laid by a snug nest for you, my pretty.—It's in a bank." I remember he added with a laugh. Dorothy and I have searched over his papers again and again, but have found nothing relating to any savings, so I never could quite make out what he meant.'

Dorothy's mother sat looking sadly into the fire for a long time, during which none of us ventured to break the silence.

As I did not wish to be late in getting home, I was soon obliged to say good-bye; and on my way out came across a hulking young fellow, who seemed to be hanging about the cottage. He slunk off on seeing me, but not before I recognised him to be Will Jackson, the son of a coast-guardman stationed at the lower end of our village. He was a lazy, good-for-nothing fellow, who had been one voyage; but finding the work too hard at sea, preferred idling about at home.

That night I dreamed that Old Quin visited me and caused me to accompany him over the hills; but what his object was, I could not make out, for I awoke just as he seemed to be on the eve of disclosing something that was weighing heavily on his spirits. Though I courted sleep again, in the hope of taking up the broken thread of my dream, I was doomed to disappointment. After this, I employed my leisure in rambling along the cliffs with a copy of the chart in my hand, trying to find anything at all resembling it in which to search. Two or three years, however, passed away without any discovery being made, and I had come to regard the whole thing as almost hopeless.

One afternoon, Ben Quin and I had rowed in-shore after a successful day's fishing, and hauled the boat up the beach of a little unfrequented bay called Flint Gap. As we had been hard at work in the sun and were tired and hot, we seated ourselves on a flat rock in the shadow of the cliffs, and after refreshing ourselves, sat talking

at our ease. Of late, I had relaxed my investigations; but some remark of Ben's made me take out my copy of the chart, and the sight of this called to mind the barrel which I had hidden away. The cave was not far off. Telling Ben I would not be long, I started up, and running over the sand, soon returned with the barrel. I took out the oilskin bag, and on carefully examining it, was surprised to find that it contained an inner pocket. In this was a piece of parchment which had escaped my notice before. To my great joy, it proved to be a more elaborate drawing of the chart or plan scrawled on the paper, with some written directions besides. Ben sat looking on in wonder, when I shouted: 'It's all right, Ben. We'll find your father's treasure; it's as plain as a pikestaff here. You'll be all rich now'—

'Whist!' said Ben at that instant, putting his finger to his lips. 'I believe there's some one listening in the gap up above. It'll be uncommon awkward if you're overheard.'

Thrusting the plan into my breast-pocket, I ran lightly up the steep narrow path and caught a glimpse of a man hurrying away. Though it was only a glance, it brought my heart into my mouth, for the man was young Jackson, who had some time before gone back to sea. He looked back on gaining the top, and seeing me following, he turned round and grumbled out in a half-sulky way: 'Well, how you startled me, to be sure, by rushing up so sudden-like.'—I looked at him without speaking, so he went on: 'I think you might give a poor shipwrecked fellow a heartier welcome, though we didn't use to be such friends over yonder,' jerking his thumb towards Shingle Bay.—'I've been through a deal of rough weather since then, and don't bear no ill-will. Let bygones be bygones, say I.'

From the shuffling manner in which he spoke, I felt sure he had been watching us and had overheard my incautious remarks; however, as there was no help for that now, I cut him short, and turning abruptly away, hurried back to Ben. Throwing the keg into the boat, in a few minutes we had her afloat, and rowed off round a projecting mass of rock where we were quite out of sight and hearing from above.

'I hope that sneaking scoundrel didn't hear all, Ben,' said I as we rested on our oars. 'It's lucky he betrayed his whereabouts before I had got any further; so let us hope there's no great harm done, after all.'

'What's done can't be helped,' quoth Ben philosophically. 'But, as you haven't told me yet what you've found out, I can't give an opinion.'

'Well, Ben, you remember that your sister said her father told her he had a snug nest put away in a bank, but that she could find no account of any money. This set me thinking, and I came to the conclusion that the paper I at first found in the keg referred to this money, which most likely had been hidden away. The drawing on this parchment makes me pretty nearly sure that if there is anything at all, it's in Danes' Camp. What I've got to do is to hit upon the exact spot.'

Ben had been looking intently at me while I was explaining, and now gave vent to his feelings in a long whistle. 'From what father said to Dolly—and he wasn't the man to make a joke—

'It's sartin he'd put by something; and, to my mind, these charts were not drawn for nothing. But after all these years, it's likely it may have been found out; still, it's worth trying; and if we can light on the place and get the money, we'll manage to fetch it away safe enough, I warrant.'

Next morning at daybreak I was out; and taking my way over the fields, wet and heavy with dew, came to the headland that rose in a bold sweep from the level land below. Right ahead, looking near in the brightness that now overspread the sky, but in reality some three miles away, appeared the low dark line which marked the ancient bank of Danes' Camp. Going on at a brisk pace, I soon got over the intervening ground, and climbing the old earthwork, commenced my search. Though broken down in some places, and overgrown with dense patches of gorse and fern and the graceful trailing boughs of the bramble, the old ditch and bank retained much of their original form: the space enclosed being roughly square, three sides were entrenched, the fourth being the sheer edge of the cliff, which here rose to a great height. Commencing at the nearest corner, I walked round the top, the parchment in my hand, and so reached the farthest extremity of the camp. I was unable to discover anything that corresponded to the plan, which consisted of an oval with the points of the compass shown. At the south-east part were four circles, enclosing a larger one marked with a cross, while an arrow pointed to the south indicated fifty yards. I looked carefully for any object from which to measure fifty paces; but what had seemed simple on first seeing the drawing, appeared hopeless in practice now.

I sat on the bank, trying to get over my disappointment, and, to amuse myself, began rolling pieces of flint down the hill, watching as they bounded away till they were stopped by the furze bushes that fringed the path beneath. Having exhausted all the stones within reach, I tried to unearth a large flint which protruded from the turf, but found it a hard job, till, exerting all my strength, it came out at last, and slipping from my grasp, rolled down the steep slope and crashed into the bushes. At that moment I heard a footstep coming towards me, and was turning round to see who it was, when, in the hole from which I had pulled the stone, I spied a gold coin, and had just time to snatch it, when a scrambling noise caused me to close my fingers upon it, and the next instant the unwelcome form of young Jackson stood over me.

'Hillo!' said he, with what was meant to be an arch smile; 'you're taking the air early this morning, shipmet.' Prudently overcoming a strong desire to send him headlong down the hill, I took no notice of his pleasantry, but, getting up, commenced to walk homeward. I hoped Jackson would take the hint, and not trouble me with his presence; but it suited him to accompany me; and as I could not very well shake him off, I had to put the best face possible on the matter. All this time I had kept the gold piece in my hand, not daring to look at it, and on the first opportunity I quietly slipped it into my pocket.

We walked on silently for some time, when Jackson broke out with: 'I had such a rum

dream last night: I thought I was digging for a potful of money some one had hid in the ground. After working for a long spell, I finds it, when up you comes and calls out "Halves!"—"All right," said I; "that's all fair and square." So we parts the lot between us.'

There was a pause at this, and then I rather awkwardly remarked: 'What of that? It was only a dream.'

'Suppose,' said he, looking sideways at me, 'you was to find anything, and I was to come along, of course you'd do the same, eh?'—putting on a simple and friendly look.

'As it isn't very likely such a thing will happen, I don't see the good of talking about it,' I was forced to say.

'Now, look here,' said he, changing his manner and speaking in a bullying tone. 'I heard you and Quin the other day talking on the beach down yonder about the paper you found and what you expected it meant. My old grandad was a mate of Quin's father in many a run of goods, and he often said the old man had stowed away a rich cargo, which ain't seen the light since, I reckon. If you like to take me as pardner, well and good; if not, look out, for you'll come off all the worse, I can tell you.'

I was rather staggered with this; for it did not strike me at first that Jackson pretended to know more than he really did. As I did not answer, Jackson gave me another threat, and then dropped behind, but followed me home at a distance.

After breakfast, as there was nothing to keep me at home, I got leave from my father to stop for a night or two at my cousin's. Jackson was not in sight when I got out again, not expecting me so soon, I suppose; so I quickly gained the hill-top, and after walking some distance, sat down where there was no fear of being overlooked, and taking out the coin, proceeded to examine it. It was as big as two of our guineas, and as it had a hole bored through it, had evidently been used as a charm. On one side were scratched the letters T. Quin. Hastily getting up, I started at a run, and did not stop till I came to the place where I had found it. The bank at this part was thickly covered with bushes, and I now noticed for the first time that they almost hid a low mound. I made out its shape to be oval; and turning my face to the south, I took fifty long paces, which brought me to a large moss-covered stone, which did not rise above the level of the ground, so that I had not noticed it before. A huge bush overshadowed the place where I had discovered the coin, and this proved to be at the south-east part of the oval mound corresponding to the positions of the five circles in the chart. It struck me that old Quin must have dropped the gold piece while working at this spot.

All excitement, I pushed on as fast as I could to Shingle Bay, and found Ben at home. Taking him aside into the garden, I told him of my discovery, and showed him the coin, which he remembered having seen his father wear. When I spoke of what Jackson had told me, he looked rather grave; but brightening up after a bit, said he had a plan to deceive him. Lighting his pipe, and seeming to be greatly assisted thereby, he went into details.

'Now, as that young scamp guesses so much about this affair, it's my opinion the best way

will be to get the treasure, whatever it be, to-night. We can smuggle a pickaxe and shovel down to the boat in an old sail when it falls dark. Young Jackson is sure to be along this way after you; and if you keep indoors until the evening, he'll most like be hanging about all day. When we go out in the boat, he'll think there's something in the wind; and as he won't have the pluck, for all his stoutness, to tackle us by himself, he's almost sure to go back and get the help of that precious cousin of his. The moon will be up by the time we land the tools and are ready to work; so, all things considered, it'll go hard with us if we can't be the first in.'

We followed closely Ben's programme; and, as he predicted, Jackson was to be seen watching us; and as soon as we were afloat, he hurried away in the direction of his home. With the tools on our shoulders, we leaped on shore at the gap, and making our boat fast, we toiled up the steep path, and came to the camp just as the moon appeared over the hill; and by its light we set to work with all speed. We cleared away the earth under the bush, and had made a good-sized hole, when the pick struck with such force against a stone as almost to overturn Ben, who was wielding it. 'There's a rock or something as hard here, George,' said he ruefully, rubbing his arm and resting his back against the bank.

I shovelled away for dear life, and throwing out a lot of loose earth, laid bare a large boulder.

'Oh, that's all, is it?' said Ben. 'I was afraid I'd struck the solid cliff.'

With the help of a crowbar we prised the stone, and dragging it out, disclosed a bundle of dry ferns and heather; and eagerly removing this, we found a snug nest with five kegs lying in it.

'Stop a bit,' said Ben. 'A little more light won't be amiss.' He stooped down and lit a lantern under cover of the bush. By it we could see the barrels were arranged in the same order as the circles in the chart.

Ben dragged out the first, and giving it a shake, declared it to be full of French brandy; another proved to be similar. He then laid hold of the middle keg, but found it so heavy that he could not move it. 'Hillo!' said he, in an excited whisper; 'this is the one worth taking care of! From the weight, it must be gold. We must get it out of this before Jackson returns, for I've an idea he won't be long.'

We dug a trench through the bank, and so were able to roll out the heavy keg. This took some time, for now the moon was mounting up the sky. Happening to look over the camp, I could distinguish two dark forms making towards us. Seeing there was not a moment to lose, I quietly told Ben they were coming, and with his help, forced the keg over the edge, and sent it rolling swiftly down the slope where I had amused myself that morning. I heard it crash through the bushes at the bottom, and then all was still.

Whispering to Ben, I replaced the two brandy barrels, and shovelled back a lot of the earth, managing this so quickly, that when Jackson and his cousin came upon us, all trace of the barrels had disappeared. We went on digging as if we were not aware of their presence until they jumped down the bank.

'So you're caught, my fine fellow,' said Jackson, commencing to scrape away at the loose earth, and in a little time dragging out one of the kegs. 'As my father's substitute, I order you, in the name of the law, to hand over these 'ere smuggled goods.'

Ben roundly refused, but afterwards, on my entreaty, consented to the arrangement. The other kegs were dragged out; and the two men continued to dig deeper, but found nothing more, seeming to have no suspicion of the trick we had played; for each at length shouldered a barrel and trudged off silently the way they had come.

We waited until they were out of sight; then, getting our precious keg into a strong basket, and placing some fish on the top to conceal it, we landed at the quay, and carried it between us, with some difficulty, to the cottage.

We said nothing till after breakfast, and then, with bolted doors, we forced in the head of the barrel, disclosing to our wondering eyes a glittering mass of gold pieces, which when emptied out on to the floor made a perfect hillock of guineas. When we had recovered our breath, we counted the treasure; but I am afraid to tell how much we made it, lest my veracity should be doubted.

The neighbours were very curious to know the cause of my cousins' sudden rise in the world; and though young Jackson never heard anything about the fifth keg, yet he evidently in some way connected my cousins' prosperity with Danes' Camp.

A SUNSET.

A soft sweet ripple comes over the sea;

The sun sinks slow to his golden rest;

And you are walking alone with me,

While a glory falls on the crimson west.

A tender light over moon and hill,

Like a mystical veil of beauty lies;

And our hearts in the silence stir and thrill,

And your soul looks out of your dear blue eyes.

The things too subtle and rare for speech,

An exquisite sympathy can divine;

Our spirits wing off on an upward reach,

With your little hand lying clasped in mine.

See yonder, Love! where the lights begin

To faint and fade in the purple air,

And the strange sweet sorrow creeps dumbly in

That the heart of the Beautiful aye doth bear.

Darling! I know that your soul grows chill,

And your heart is full of a vague regret,

As the glory fades from each radiant hill,

And the shadows fall where the sun has set.

Yet, dear, in the future you cloud with doubt,

Our hearts will love as they love to-day;

The light of our loving can ne'er die out,

Nor our souls, unheeding, walk far away.

SOUTHWARK IN THE OLDEN TIME.

LONDON is one of the oldest cities in the world, and no authentic date can be assigned to its foundation. Many treatises have been written since Tacitus on the one hand and Milton on the other severally propounded their Trojan, Celtic, and British theories. Its name, legends, and renown, together with its marvellous growth, have awakened many an historic echo, and inspired eloquent and poetic pens.

It is a startling thought, as we look on the myriad buildings, churches, and warehouses, with the rushing crowds which surround them, that there was a time when forests came down to the margin of the river Thames, and wild beasts roamed about in them—when the rising grounds and partially cleared glades were occupied by rude huts scattered here and there, and skin-clad aborigines herded their cattle and mended their nets on the site of the greatest city the world has ever seen.

The record of the gradual growth of London abounds with interest, whether we regard the causes or their operation. Its history is closely connected with civilisation, liberty, and art; and many a landmark remains by which we can trace its progress and recall its ancient features. Our imagination is enabled to rebuild its massive walls and to repeople its civil and ecclesiastical edifices—to follow the footsteps of Britons, Romans, Danes, and Normans, as they successively lorded over it, and thus to learn something of their habits and customs; and although the fragments are fast vanishing before the march of modern improvements, enough remains to afford pleasure and profit in our researches. We can disinter noted spots and describe their hallowed memories; can explore their highways and byways; and can adduce much collateral evidence as to men and things connected with the Great Metropolis.

It is impossible at the present time to define the beginnings and endings of London. 'As well,' says a writer, 'might we try to determine the lines of demarcation in the distinct yet blended

colours of the rainbow.' The suburbs melt and fade into the country, and each year the circle around the city grows wider. It has been said that the inhabitants of the mighty conglomeration of houses, streets, squares, and warehouses which make up the royal city have hardly more definite ideas of its vastness than have the fishes of the wide Atlantic of the immensity of the ocean in which they swim.

Our minds cannot adequately grasp the enormous area, or properly apprehend the meaning of a circuit of one hundred and twenty square miles, containing more people than the whole kingdom of Scotland. Were the houses set less than a yard apart, the line would reach from Land's End to John o' Groat's, thence to the South Foreland, and back again along the coast to our starting-place; in all, a vast triangle of about two thousand five hundred miles.

It is not, however, the London of to-day to which we seek to introduce our readers, but the London of mediæval times. We will suppose that our first traveller hails from the Continent—perchance a soldier returning from the wars of Germany, France, or Italy. He may be a scholar or learned doctor from Padua, or a merchant from the Low Countries, Genoa, or Venice. He has crossed the narrow sea, and being a man of knowledge and intelligence, has gathered folklore as he journeyed from Dover through the pleasant fields and gardens of Kent. It is summer-time, and the orchards, vines, crops, and flowers are in full bloom or promise amidst the quiet beauty of the landscape. He has marked with the keenness of the archaeologist and the reverence of the Christian the many village churches, which add charms to every succeeding prospect, and which well repay close and careful examination. Then, as now, the chime of their sweet and sonorous bells sounded through the quiet air. He sees the gabled cottages with clustering vines and creepers, the picturesque rambling farmhouses, with tall chimneys and far-projecting eaves—the more substantial granges with quaint oriels, bold porches, and high roofs, surrounded by moats, now dry and

green—and the stately mansions of England's chivalry, bristling yet with battlement and bastion, but becoming pierced by external openings for exit and for light—sure sign of dawning security and peace.

As he passed through Canterbury, our traveller pauses to pay his devotions in the majestic cathedral, venerable in age and associations. He has knelt before the glittering shrine of St Thomas à Becket, soon to be despoiled; and has provided himself with relics as mementoes at Harbledown. He pursues the well-trodden pilgrim-way under the white cliffs and the breezy downs, through many a straggling village and sleepy town, till he reaches Dartford, the first posting station out of London. Here all is activity night and day with relays of post and pack horses prompt for the service of courtiers, couriers, and merchants. Black—then Bleak—Hill is reached and left behind, and Eltham's royal palace in the height of its splendour—now, alas! a farmhouse, and its high festal Hall a barn. Many conventual buildings repose around with full array of monastic appurtenances.

Entering the Kent Road or Street, he arrives at the boundary of London liberties, St Thomas-à-Watering, the precise spot being at the present junction of Albany Street with the old road. Hither the Lord Mayor and sheriffs were wont to come annually in civic state to inspect the boundaries, and, as a stream flowed over the road, the citizens used jocularly to speak of 'going over the water.' This spring was dedicated to St Thomas of Canterbury, and gave the place its name. King Henry V. was here welcomed on his triumphant return from France after the victory at Agincourt; and Hall records 'the solemn procession lauding and praising God for the high honour and victory to Him given and granted.' A gallows was erected near at hand, on which frequent executions took place. One of the quarters of the unfortunate and misguided Sir Thomas Wyatt, who led the Kentish men against Queen Mary, was exposed at St Thomas-à-Watering in 1554; and the last execution took place in 1760. All signs of the locality have long been obliterated, and few among the passers-by have any knowledge of these scenes of pageantry and of blood. Gerarde, the great herbalist and botanist, who died in 1607, says the wild willow-herb is to be found nigh to the place of execution at St Thomas-à-Watering.

Southwark begins where the country road ends, and comprises an area larger than the city itself. It was in far-off times mostly a dull and dreary marsh or swamp, where the wildfowl and bittern found a home, and extended from the river southward to those rising grounds now known as Clapham, Streatham, and Brixton. Islets rose above the waste of ooze and water; and a straggling forest, affording lurking-places for evil-doers, grew around. In 1578 there was a presentment made to Burleigh by Fleetwood the Recorder, who urges that 'the south side is dark and shadowed with trees, affording an admirable place for such doings, a bower for conspirators,' &c.

The Romans had embanked the shore of the Thames, had formed the broad highways of the Watling and Ermine Streets through the morass and forests, and had probably constructed a bridge to connect the shores. Remains of villas and other buildings, together with urns, tiles,

and coins, have been found in abundance all along the road in the stratifications of two thousand years. The Danish vikings afterwards moored their war-galleys in the creeks and along the shore, when, in their frequent and audacious descents, they ravaged London, carrying desolation and dismay alike into the home, the palace, and the church. The Saxons subsequently fortified the suburb, using the old Roman material, whilst they in their turn were dispossessed by the conquering Norman William in 1066, who speedily bestowed the best and richest portions of the land on the priests. From Lambeth westwards, to Bermonds-Eye on the east, nearly all belonged to the Church, as did also about two-thirds of the city of London. Then arose abbeys, priories, and monastic institutions of all kinds, stately edifices and palatial dwellings, with all the appurtenances of ecclesiastical domination and wealth.

The name Southwark has been spelled by chroniclers in twenty-seven different ways; but the meaning is the same—the south work or fortification of London. The place has share in the great history of the times, and was the avenue along which most foreigners came. Many notable personages are associated with its chronicles; and innumerable processions, regal, civil, ecclesiastical, and military, have flitted in rapid succession over its raised causeway.

At the time of our traveller, disorders abounded, and the neighbourhood was rendered unsafe by reason of a loose and riotous class inhabiting the rude hovels scattered around the low-lying districts on each side of the highway. The reputation of Southwark has always been more or less questionable. In the reign of Edward III. the manor was bestowed on certain religious fraternities, 'that they might take order with the lawless population, and bridle the naughtiness of the said malefactors.' Sundry prison-houses had been called into existence, to aid in this laudable mission; and as years went by, they multiplied on every hand. There was the Clink in the liberty of that name, belonging to the bishops of Winchester, situated westward of their palace; the clink, or prison, being especially provided for 'the incarceration of those who would bray and babble, or otherwise break the peace of our lord the king.' This dismal prison was near to the Bank-side, the street still called by its name recalling the site. Near by dwelt Beaumont and Fletcher, Massinger and Oliver Goldsmith, the last of whom in later times had earned a scanty and precarious living as a doctor. Many a righteous man was confined in this noisome jail, and endured with high constancy unjust and cruel treatment; and some prisoners of note languished for years unpitied and alone.

The Marshalsea was so called 'as pertaining to the Marshalls of England.' Offences committed within the verge of the Court, and matters of contempt and of debt, were purged here, often with the whole life of the offender and forfeiture of all his property. The *White Lion*, also an old hostelry, was one of the many jails; and Stow tells us that it had been so since 1550, and was generally filled with murderers and malefactors; and in the seventeenth century, with those oftentimes misguided though sincere men known as Puritans and Quakers. Outside

these abodes of horror, filth, and starvation, clamoured an array of utter vagrants, gathered in numbers to ply by day and by night the trade of theft and of beggary, wandering about either singly and silently, or in companies when robbery upon a larger scale was designed.

Through such scenes and amidst such uproar our traveller makes his way, never heeding the scowling looks of evil-disposed men gathered round the doors of low taverns, or under the pent roofs of the stalls scattered sparsely along the highway—a good quarter-staff, a stout heart, and a strong arm standing him in stead amidst the scenes of riot and lawlessness.

He called to mind the various industries possessed by Southwark: at one period the pickled herring business, which promised to bring much wealth and commercial prosperity; but from jealousies and sundry unexplained causes, it languished, and was carried by the promoters to Holland. There were also vinegar manufactories and breweries from a very early period, the latter taking deep root, and the largest passing through the hands of Thrale, Dr Johnson's friend, with whom he frequently abode both here and in Streatham, to its culmination in the gigantic establishment of Barclay and Perkins, whose premises cover many a spot of renown in the middle ages, civil, ecclesiastical, and theatrical—for part of the Globe playhouse, the old Non-conformist chapel, and portions of the grounds of abbots and priors, have been from time to time absorbed by these immense works.

A large area was occupied by the Mint, which at first was a sanctuary for insolvents, and afterwards contained a sumptuous mansion, built by Charles, Duke of Brandon, in 1518, shortly before the time of our traveller's visit. This edifice was nearly opposite to St George's Church, and portions belonging to it—parts of the staircases, doors, and other fittings—have been found built into neighbouring houses. When the Duke fell by attainder, and the property reverted to the king, money was coined there, hence the name given to the region around. Queen Mary bestowed the domain for a residence on the Archbishops of York, when the see was deprived of York House, Whitehall; but it was found to be out of the way and otherwise inconvenient; and, permission being obtained, it was sold, and shortly afterwards pulled down for the purposes of trade.

The Mint was 'a refuge for the worst and lowest' of the people, and was called that 'unhappy country.' Violence often resulting in death was not uncommon, and deeds of darkness occurred daily within its precincts. Travesties of Church rites were permitted, and marriages and christenings took place in taverns and shops similar to those which created so much obloquy in the Savoy, the Fleet, and in Mayfair. These nefarious transactions were legal and binding; but so much scandal ensued, that an Act of parliament was passed which suppressed them early in the eighteenth century. In the Mint was a gallows for executions, stocks, and many minor lockup-houses and prisons. The very names all around, many of which have survived, were suggestive of the bad repute of the neighbourhood—such as Barefoot and Labour-in-vain Alleys, Hangman's Acre, Dirty Lane, Harrow Dunchill, and many more of similar import.

Southwark Fair was in full swing, and our traveller beheld its sights, amusements, and orgies with amazement and dismay. The scene has been immortalised by Hogarth, whilst both Pepys and Evelyn enlarge on the tricks, mummeries, and immoralities practised there. The Fair lasted three days by statute, but generally extended itself beyond a week, often for fourteen days. It was suppressed in 1762. Being held the day after that of St Bartholomew in Smithfield, the excitement and uproar were simply transferred across the water. One feature in this yearly carnival consisted of playacting in inn yards, taverns, and elsewhere. Some representations were good, and others tolerable, but the greater part low and of the very worst tendency.

The great inns were said to possess secret chambers, to which citizens and the young were enticed by guile and stratagem, for the purpose of robbery and injury. In the courtyard was often to be seen a movable theatrical stage, the galleries and windows being crowded with the guests, and with spectators drawn in from all parts. There were also booths reared on vacant ground, where plays were performed.

Local courts were granted for rough-and-ready justice on offenders caught redhanded. They were exclusively for enforcing the laws and regulations of the Fair, and were erected only within its precincts. They were called Pie Powder, or the dusty foot, referring to the people coming and going. It is supposed that this tribunal might have been located in the town-hall, which was in the midst of the racket and noise.

A DEAD RECKONING.

CHAPTER XIII.

CUMMERHAYS, in one of the most northerly of the northern counties of England, although it considers itself to be a place of no small importance, has not the good fortune to be situated on any of the great main lines of railway; consequently, to most people it has the air of being somewhat out of the world. Of late years, however, a branch line has found it out, and has thereby enabled it to emerge from the state of semi-torpor in which it seemed destined to languish for ever. The branch line in question, of which Cumerhays is the terminus, is about twenty miles in length, and leaves the main line at Greenholm Station. About halfway between the two places, but about a couple of miles distant from the line itself, are certain important collieries, to meet the requirements of which a secondary branch has been constructed, which turns abruptly from the main branch at a point dignified with the euphonious title of Cinder Pit Junction. Here a signalman's box has been fixed, a wooden erection, standing about six feet above the ground, with an arrangement of levers inside it, for working the points and signals in connection with the traffic to and from the collieries. At the time of which we write two men were stationed at the box in question, who came on duty turn and turn about, in each case a week of day-duty alternating with one of night-duty. The cottage of one of the

signalmen was about half a mile from the box, on the road leading to the collieries; while that of his 'mate' was about a quarter of a mile down the road in an opposite direction.

Into this second cottage, which stood by itself in a lane a little removed from the high-road, and having no habitation near it, we will venture, Asmodeus-like, to take a peep on a certain April evening. It was already dusk in the valleys, although a soft rosy light still made beautiful the tops of the distant fells.

In half an hour James Maynard, the signalman, would be due at his box to take his 'spell' of night-duty. His thick blue overcoat was hanging behind the door ready to put on, his wife was washing up the crockery, and Maynard himself was smoking a last after-tea pipe before leaving home. He was a well-built stalwart man, with a jet-black beard and moustache, and close-cut hair of the same colour, to which his dark-blue eyes offered a somewhat striking contrast. He had been about three months in his present situation, and among the drivers and guards who worked the traffic between the junction and the collieries he had come to be known by the sobriquet of 'Gentleman Jim.' It was not that he ever set himself up as being in anyway superior to or different from his mates; indeed, he was universally popular; but these grimy-faced men, who in their way are often keen observers of character, had an instinctive feeling that, although necessity might have made him one of them to outward seeming, he was not so in reality, and that at some anterior time his position in life must have been widely different from that which he now occupied. But genial and good-natured though 'Gentleman Jim' might be, he was a man who brooked no questioning, and no one therabouts knew more about him than he chose to divulge of his own accord.

Maynard and his wife had been chatting pleasantly together. Suddenly the latter laid a hand on her husband's arm to bespeak his attention. 'What is it?' he asked. 'I heard nothing.' 'There was a noise of wheels a moment ago, and now it has ceased. It sounded as if some vehicle had stopped suddenly at the end of the lane. Do you remain in the background, dear, while I go and ascertain whether any one is there.'

She opened the door and went out quickly. There was still light enough in the valley to see objects a considerable distance away. One side of the lane in which the cottage was built was bounded by a high bank. Up this Mrs Maynard now clambered, assisted by the branch of a tree; she knew that from the top of it she could see not only the lane, but a considerable stretch of high-road on either hand. After gazing for a moment or two, she leaped lightly down and ran back to the cottage. 'A carriage with two horses is standing at the corner of the lane,' she said to her husband. 'A lady has got out of it and is coming towards the cottage, and—oh, my dear—I'm nearly sure it's Lady Fanny Dwyer.'

'Lady Fan! Well, I shall be very glad to see her. No doubt she is visiting at Seaton Park; and as she knows we are living in the neighbourhood, she must have made inquiries and discovered our whereabouts.'

'I hope she has not made her inquiries in such a way as to arouse any suspicion that we are at all different from what we seem to be?'

'I think you may trust Lady Fan for that. She generally knows pretty well what she is about.—But had you not better go and meet her?'

Clara hurried to the door; but as she opened it, Lady Fan appeared on the threshold. She looked a little white and scared, adventures with a spice of risk or romance in them not being in her usual line. Making a step forward and grasping Clara's hand, she said in a whisper: 'Is it safe to speak aloud? Is there any one but yourselves to hear me?'

Reassured on this point, Lady Fan threw herself into her friend's arms and burst into tears, holding out a hand to Gerald as she did so. 'I can't talk to either of you till I have had my cry,' she said between her sobs. 'What a wicked, wicked world this is!'

She grew calmer in a little while, and sat down close to Clara, holding a hand of the latter while she talked.

Here it may be remarked that it was through the influence of Lady Fan's husband that Gerald Brooke had obtained his present situation as signalman at Cinder Pit Junction. The mode of life was of his own choosing. He wanted something to do that would take him out of himself as much as possible, and while not entirely isolating him from his fellow-men, would not bring him into contact with too great a number of them. In this out-of-the-way valley among the fells and moors, if anywhere, shelter and safety might surely be found.

'O my dear, my dear,' cried Lady Fan as she dried her eyes and looked round her, 'and has it really come to this, that this dreadful poky little hole of a place is your home—the only home that you have!'

'It is not a dreadful little hole by any means, dear Lady Fanny,' answered Gerald with a smile. 'It is a substantial well-built cottage of four rooms—quite large enough for a family without encumbrances. You don't know how snug and comfortable we are in it. Economy of space is not half enough considered in a small world like ours.'

'I am glad you keep up your spirits,' retorted her ladyship; 'though how you contrive to do so under such circumstances is a mystery to me.'

'We have really and truly been very comfortable since we came here,' answered Clara. 'I have conceived quite an affection for our little house, and somehow, I hardly know why, I feel as if we were safer here than elsewhere. Probably it is the loneliness of the place that gives one this feeling of security; and then the air that blows down from the moors is so pure and invigorating that both Gerald and I feel as if we were growing young again.'

'Oh, of course you try to make the best of everything—it's just your aggravating way,' retorted Lady Fan. 'But if I were in your place, I should fret and fume and worry, and make myself and everybody about me as miserable as possible. That would be my way.'

'I don't believe it,' answered Gerald with a laugh. 'You don't know how many unsuspected

qualities you possess that go towards making a capital poor man's wife.

Lady Fan shrugged her shoulders. 'And so you, Gerald Brooke, the owner of Beechley Towers, are living here as a common railway signalman,' she said; 'finding your companions among a lot of engine-drivers and—shunters, don't they call them?—and grimy people of that kind. What is the world coming to?'

'My companions may be grimy, as you say; but I can assure your ladyship that they are a very hard-working, good-hearted, decently behaved set of fellows, and that among them is more than one of whose friendship any man might be proud. And I can further assure you, Lady Fanny, that I am quite satisfied with my mode of life—for the present and till brighter days return, if they ever will return. And that reminds me that I have had no opportunity of thanking Dwyer for the trouble he must have been put to in procuring me my present situation. Is he here with you?'

'Oh dear, no. His last letter was dated from Cairo; where his next will be dated from, goodness only knows.'

'Well, I hope you won't forget to thank him for me when next you write.'

'By the way, how did you succeed in finding us out?' asked Clara.

'To tell you the truth, my dear, one of my chief objects in accepting an invitation to Seaton Park was the hope of seeing you and your good-for-nothing signalman. I knew you were living close by, but not exactly where. I also knew that you were passing under the name of Maynard. Accordingly, I set my maid to work to make certain inquiries, telling her a white fib in order to stifle any curiosity she might feel in the matter; in fact, my dear Clara, I gave her to understand that before your marriage you had been in my service, and that I was desirous of ascertaining how you were getting on in life. It was the most likely tale I could think of, and I've no doubt it answered its purpose; anyhow, this morning Simpkins brought me your address, and here I am.'

'How it brings back the memory of old times to see you and hear your voice!' said Clara. 'It seems years since I left the Towers, although it is only a few short months ago. I am often back there in my dreams.'

Lady Fan squeezed her friend's hand in silent sympathy. Then she said: 'By-the-by, what has become of darling, quaint Miss Primby? I hope she is quite well?'

'She has gone to stay for a time with some friends in Devon. This place was too bleak for her during the winter months; but now the spring is here, she will be back with us again before long.'

'You talk as if you were likely to remain here for ever and a day,' answered Lady Fan. 'And that reminds me that I have done to-day as our sex are said to do habitually with their postscripts—that is, I have left mentioning till the last the most important of the reasons which brought me here. Algy, in the last letter I had from him, charged me to either see or communicate with you as early as possible, and tell you from him that his banker is at your service for any amount you choose to draw upon him. He has a lot of

money lying idle, and would only be too glad if you would favour him by making use of it.'

'Dwyer is a noble-hearted fellow, I know, but'—

'But me no buts,' broke in her impetuous ladyship. 'There is no reason why you should not end this mean and sordid way of life at once. There are plenty of charming nooks on the Continent where you and Clara might live with everything nice about you while waiting for better days; and really you would be doing Algy a great kindness at the same time.'

But this was a point on which Gerald was not to be moved. He combated Lady Fanny in almost the same terms that he had combated Karovsky when the Russian had made him an almost identical offer. He would never leave England, he said—on that he was determined—till the mystery that enshrouded Von Rosenberg's death should be cleared up and his own fair fame vindicated before the world. There was within him a hidden faith that, like an altar flame, sometimes burnt high and anon died down to a mere spark, but was never altogether extinguished, that one day his long waiting would be rewarded.

Lady Fan fumed and lost her temper, and then recovered it again with equal facility, but in no-wise shook Gerald from his purpose. The striking of the hour startled them both.

'Eight o'clock and Sir William's horses waiting for me all this time!' exclaimed Lady Fan.

'And I'm a quarter of an hour late,' said Gerald to his wife. 'Lucas will begin to think something has happened to me.'

Lady Fanny's last words to her friend were: 'To-day is Tuesday. I'll come again on Thursday, when we will have a good long talk together, by which time I hope that obstinate and wrong-headed husband of yours will have come to his senses.'

Gerald Brooke had kissed his wife and had gone off to his duty at the signal-box, leaving her alone in the cottage. But not long would she be left in solitude. Margery, who had gone to Overbarrow, a village about two miles away, to purchase some groceries, would be back in a little while.

But half an hour passed after her husband's departure without bringing Margery, and Clara began to grow seriously uneasy. Never had she been so late before. When the clock struck nine and still the girl had not come, Clara could contain herself no longer. Putting on her bonnet and shawl and locking the door, she hurried down the lane, and turning into the high-road in a direction opposite that which led to the railway, she went quickly forward along the way by which she knew Margery must come. The night was dark and moonless, but the stars shone clearly, and by their faint light Clara could just discern the black outlines of the hedge which bounded the road, and thereby keep herself to the line of narrow turf-bordered footway which ran by its side. She had not gone more than a quarter of a mile when her heart gave a throb of relief. She heard footsteps advancing towards her, and her fine ear recognised them as those of Margery, even while the latter was some distance away. 'Is that you, Margery?' she called, so that the girl might not be startled by coming suddenly upon her in the dark. A moment later they

had met. Margery had been hurrying home at such a rate as to be nearly breathless.

'O mum, he's here! I've seen him, and heard him speak,' were the girl's first incoherent words.

'Who is it that you have seen and heard?'

'Muster Crofton, mum—Muster Geril's cousin—him as the Frenchy tied up in his chair.'

'George Crofton here!' murmured Clara, her heart seeming to turn to ice as she spoke. 'Surely, surely, Margery, you must be mistaken.'

'I only wish I was, mistress,' responded the girl fervently; 'but he only need speak for me to pick him out of a thousand men in the dark. Besides, I saw his face with the cut in his lip and his teeth showing through.'

For a little while Clara was so dazed and overcome that she could neither speak nor act. In that first shock her mind had room for one thought and one only: George Crofton was on the track of her husband! No other purpose could have brought him to this out-of-the-world place. Gerald must be warned and at once; but first she must hear all that the girl had to tell. She had turned mechanically, and was now retracing her way to the cottage.

'I suppose Mr Crofton saw you at the same moment you saw him?' she said anxiously.

'I saw him, but he never set eyes on me.'

'How could that happen?'

'I'll tell you all about it, mum. I had got my groceries and had left the village, and was coming along pretty fast, 'cos I was a bit late, when just as I was getting near the end of a lane I hears two men coming along it talking to one another. I was not a bit a-fear'd; but still I thought I might as well keep out of their sight; so just before they turned out of the lane, I slipped into the dry ditch that runs along the hedge-bottom and crouched down. They passed me without seeing me, still talking, and then I knowed at once that one of 'em was Muster Crofton. "We are before our time," says he to the other one; "we shall have nearly an hour to wait." Then says the other: "Better be afore our time than after it." After going a bit up the road, they crossed it, and passing through a stile, got into the fields, I making bold to skulk after 'em, first taking off my shoes so as they shouldn't hear me. On they went, I following, till they came to a hollow where there's a lot of trees, and in the middle of the trees a little house that seems, as well as I could make out, as if somebody had pulled it half to bits and then left off. When they were well inside, I followed on tiptoe; and then I heard one of 'em strike a match, and then I saw a light through the broken shutter of a little window. Going up to the window, I peeped in. Two lanterns had been lighted, and by the light of one of 'em I could see Muster Crofton's face quite plain. I couldn't make out much of what they talked about, only that they were waiting for somebody, and once the other man said: "We shall be quite time enough if we leave here by half-past ten." Then Muster Crofton, he swore, and said that he never could a-bear waiting.'

'Did you hear them mention your master's name?' asked Clara anxiously.

'No, mum, not o'fsee.'

Clara was puzzled. To her wifely fears it seemed impossible that Crofton's presence should

not bode danger to her husband. It was almost incredible that he should be there unless he were on the track of Gerald. Yet, on the other hand, what could be the nature of the business which took him at that late hour to a ruined cottage buried among trees? It almost looked as if he were concerned in some dark and nefarious scheme of his own. Suddenly a fresh thought struck her, and as it did so she came to an abrupt halt.

'Margery,' she said, 'you shall show me the way back to the cottage among the trees. I will go and endeavour to find out for myself what it is that has brought Mr Crofton so far away from home. Come.'

'O mistress!' said Margery with a gasp. It was her only protest: with her to hear was to obey.

TOYS, ANCIENT AND MODERN.

A TOY is perhaps best defined as a trifling object, designed for the amusement of the young; and we may safely infer that wherever children have existed, they have not been without playthings. From the earliest historical times we find traces of toys, many of them of complicated and ingenious construction. Among the specimens disinterred from Egyptian tombs are dolls, elastic balls, round pellets, evidently used in the same way as our modern marbles, and footballs securely covered with leather. Movable puppets have also been discovered, consisting of jointed figures capable of working rollers, kneading bread, &c., when pulled by a string. Models of animals of all kinds seem to have been pretty abundant among the Egyptians. The crocodile is not unnaturally one of the most common of these, and some wooden crocodiles have been found with the upper jaw hinged.

The tombs of Golgoi and Idalium in Cyprus have supplied us with some specimens of the toys of ancient Greece, such as painted dolls of clay modelled with the fingers, mounted cavaliers armed with shields, and cars to which horses are harnessed four abreast. We also know from Suidas that the Greek lads anticipated our own in the use of whipping-tops.

The Roman toys were of various kinds, including popguns, bows, and arrows, and many varieties of dolls and puppets, some of the latter being loose-jointed and movable by a string, like our modern marionnettes. The whipping-top, too, which was perhaps borrowed from the Greeks, was a favourite toy, and is thus referred to by Virgil in the seventh Book of the *Æneid* (Conington's translation)—

Like top that whirling 'neath the thong
Is scourged by eager boys along;

Bent on their gamesome strife:

With eddying motion it careers

Round empty courts in circling spheres;

The heedless troop in stinging amaze

Upon the winged boxwood gaze;

The lashes lend it life.

Dr Paris, in his curious and interesting book, *Philosophy in Sport made Science in Earnest*, says that the Romans probably introduced this toy into Britain. A game very similar to marbles, but played with nuts, seems also to have been common in ancient Rome; it is stated by Suetonius that Augustus when a youth spent many hours of the day in playing with little Moorish boys 'cum nucibus.'

The same toys, with variations, seem to have been popular throughout the Middle Ages. Marginal paintings in fourteenth-century manuscripts represent boys whipping toys of much the same shape as those now in use; and a writer in 1587 mentions rattles, balls, wooden horses, and drums as among the current toys of his time. In the Harleian Manuscripts at the British Museum there is a very curious anecdote about the whipping-top, showing it to have been well known about the end of the sixteenth century; it refers to Prince Henry, the eldest son of James I. of England and VI. of Scotland: 'The first tyme that the Prince went to the towne of Sterling to meete the king, seeing a little within the gate of the towne a stacke of corne, in proportion not unlike to a topp, wherewith he used to play, he said to some that were with him, "Loe, there is a goodly topp;" whereupon one of them saying, "Why doe you not play with it, then?" he answered: "Set it up for me, and I will play with it."'

Our modern toys are so varied as to defy enumeration, and their rough classification is the most that can be attempted. Imitation being the foundation of many childish modes of recreation, we are not surprised to find that it has been largely drawn upon in the construction of toys. Horses, dogs, babies, houses, windmills, and boats form very favourite playthings, and are made in materials so widely different as iron, wood, wax, and india-rubber. Additional faithfulness to nature is obtained in some cases by adding mimicry of sounds and actions; thus, dogs are made to bark, dolls to open their eyes and utter strange noises supposed to mean 'Mamma' or 'Papa'; while monkeys climb up a pole, and mice run about the floor. Another species of toy, perhaps the most valuable educationally, as well as the most really interesting, appeals to the spirit of emulation and the love of success inherent in human nature, rather than to any intrinsic merit in the playthings themselves. To this class belong marbles, balls, cards, bricks, tops, kites, &c., in fact all toys which call for the exercise of skill and ability when played with. A third kind owes its success to exciting the feelings of wonder and surprise; but as these emotions are of a low order and are in their nature transient, such toys must take inferior rank from an intellectual point of view. Among them we may reckon the magnetic swan, which follows a lodestone over the water, the automatic figures worked by sand or hidden mechanism, and crackers, jacks-in-the-box, &c. Lastly, come the kind which give pleasure to children by gratifying their love of noise, including trumpets, drums, pistols, and squeaking abominations of all sorts. These probably give more annoyance to the elders than pleasure to the youngsters.

At the present time, the production of toys employs a large number of persons in Europe, and some in the United States. During the five years 1882-86, the imports of this country alone amounted to £2,898,147, an annual average of £579,629, a sum nearly equal to our annual expenditure on foreign watches. Germany has the lion's share of our import trade (£320,000), Holland being a bad second with £125,000. France sends us toys to the value of about £90,000 per annum; and the rest of the trade

is principally done in Belgium, though a small quantity is now received from the United States. We also make a great many at home, and do an export trade estimated at about £60,000 a year, principally to the colonies, Africa, and South America. Wooden carved toys are chiefly made in Germany and Switzerland, the cheaper kinds in the neighbourhood of Nuremberg, and the better qualities at Sonneburg, in Thuringia, from which latter place about twenty-four million articles, valued at £800,000, are annually exported. Large quantities of wooden toys are also made in Saxony, where an ingenious process is in use for diminishing the labour involved in the production of animals. A circular block of soft wood is turned into a ring of such a pattern that by slicing it vertically a rough representation of an animal (say an elephant) is secured. Each rudimentary figure is then trimmed by hand, the ears, trunk, tusk, and tail, all of which are separately turned and sliced by the same method, are inserted; and when the animal has been painted and varnished it is ready for use. Clay marbles also come exclusively from Saxony, being made from a clay not found elsewhere. The better qualities come from Holland, where they are made from fragments of alabaster and other stones. *Taw* and *ally*, the common names for the two qualities principally used in this country, are abbreviations of *turning* and *alabaster*. A great ten days' toy-fair is annually held at Leipzig, when more than six thousand merchants exhibit their goods in every available inch of space, even in the garrets of the six-storied houses. Marburg, in Hessen, is chiefly occupied with the manufacture of musical toys; while Biberach, in Wurtemberg, is noted for substantial metal articles, such as carriages, locomotives, furniture, &c. The specialty of Switzerland is wooden cottages, models, &c. Some of the large dealers do very well out of the industry; but the actual toymakers in both countries are miserably paid, and find it very hard, even by the most unremitting toil, to gain a subsistence from their employment, many of them being obliged to supplement their earnings by engaging in outdoor labour during the summer. The productions of Holland are very similar to those of Germany.

The best and most expensive toys are always of French origin, that nation being noted in all branches of manufacture for its taste and skill. In mechanical toys of all kinds the French are specially pre-eminent, and have been noted for many centuries as makers of automata. As early as the thirteenth century one Willars de Hanecort constructed an angel that 'would always point with his finger to the sun'; and in the time of Louis XIV. Philip Camuz invented a wonderful group of automata for that monarch. It consisted of a coach and four horses, which started off at the crack of a whip, the horses prancing, trotting, and galloping in turn. It ran along until it arrived in front of the king, when it stopped, and a toy footman descended, who opened the carriage door and handed out a lady. The latter courtesied to the king and presented a petition, after which she re-entered her carriage and was driven away. In the eighteenth century, Jacques Vaucanson, known as the king of automata constructors, made a flute-player which was one of the wonders of the time. D'Alembert tells us that this remark-

able figure stood upon a pedestal in which a portion of the mechanism was concealed, and not only blew into the instrument, but increased and diminished the sound with its lips, performing legato and staccato passages admirably, and fingering with complete accuracy. This automaton made a great sensation when exhibited in Paris in 1738; and Vaucanson was encouraged to make more toys of the same kind, including a flageolet-player and a mechanical duck. The latter waddled, swam, dived, and quacked, besides picking up and swallowing its food.

Modern French toys are chiefly made in Paris, especially in the Quartier du Temple, and great subdivision of labour is practised. One man, for example, is entirely occupied in making animals which strike drums with their paws, and there are six factories which produce nothing but brass trumpets. Like the rest of his countrymen, however, the French toymaker does not understand the art of selling, and he thereby gives an opportunity to the enterprising German, of which the latter readily avails himself. So it happens that the less skilful but more wily Teuton lives a good deal on the Frenchman's brains by imitating his novelties on a cheaper scale, and a French invention originally brought out at eight or nine shillings is speedily undersold by a German imitation at a shilling.

The English toymaker is reproached with being unenterprising and inartistic, but he does very well in some branches of the trade. He is especially good at wooden horses in general and rocking-horses in particular, exporting the latter even to Germany. Carts and vehicles of all kinds, drums, dolls' houses, and most heavy toys are made in London, as are also those made of glass, stone, pewter, and india-rubber. Wax and rag dolls are also English specialties, and give rise to a considerable export trade. For a long time our supply of this toy was almost entirely derived from the Netherlands, which caused dolls to be known in this country as 'Flanders babies.' The dolls had round cannon-ball heads and curiously articulated limbs, and the fact that they were to a great extent made by children gave rise to the old couplet:

The children of Holland take pleasure in making
What the children of England take pleasure in breaking.

At the present time, however, the bulk of our foreign supply comes from France and Germany. In wax dolls our export to America is considerable, as, owing to climatic reasons, they cannot be made there. It seems that wax will not set in very hot weather, and cracks in severe cold, so that a continent which suffers from both extremes is obliged to obtain its supply from abroad. We also send a goodly number of rag dolls for the amusement of the little negroes in America and Africa. These latter have faces of wax, covered with an outer skin of muslin, and the heads, both for them and for the wax dolls proper, are made in moulds, and require skilled workmen to conduct the operation. The bodies are mostly made by women and children, and are paid for at very low rates, owing to the pressure of unskilled competition. Readers of *Our Mutual Friend* may have suspected that the occupation of Jenny Wren, the dolls' dressmaker was one invented for her by the author; but such was not

the case, as the larger firms in the trade regularly employ dressmakers to clothe their toys.

Two minor branches of the doll-industry form distinct trades—the making of shoes and eyes. The shoes are made from the waste material of children's ornamental shoes and boots; but this branch is a smaller one than that of eye-making, as many dolls are sent out with merely painted boots, while all or nearly all have proper eyes. McCulloch says in his *Commercial Dictionary* that a manufacturer of the latter has been known to receive a single order for five hundred pounds' worth: and although this statement was afterwards disputed, it seems certain that large orders are sometimes placed. Dolls' eyes are of two sorts, known technically as common and natural. The common are simply coloured hollow glass spheres of white enamel, black and blue being the only colours used; the natural eyes are of similar composition, but have the pupil and iris correctly represented. Considerable quantities are exported, especially to French doll-makers. The black eyes are used for dolls exported to South America, and blue eyes for those used at home, children naturally preferring their dolls to have eyes of a similar hue to those most common amongst themselves.

A LEGAL SECRET.

CHAP. III.—SIDNEY'S CLIENT.

THE little inky parlour in Took's Court grew more inky than ever; for Abel Norris sat there at his old desk, copying diligently from morning till night. He was completely in his element.

Not unfrequently more often towards the afternoon—Sidney Trench would look in; and sometimes, Rosa being there, he would exchange a few words with her. And if the young girl was absent, Sidney never failed to inquire after her of the old clerk. They sometimes met—but this was on rare occasions—in New Square or Lincoln's Inn Fields; for Rosa was much impressed with the number of carriages which drove up to the door of Trench, Pilkington, and Trench's office. They suggested quite a fashionable reception. From ten in the morning until four o'clock in the afternoon clients never ceased to come and go. She tried to gain a glimpse of Mr Pilkington more than once, but only succeeded in obtaining a distant view of his bent figure when stepping in or out of his carriage.

Some weeks passed by. One afternoon towards six o'clock, when the days were growing longer, Rosa strolled round New Square. It was an afternoon that she long remembered; the trees were beginning to grow green, and the sparrows chirped over the coming summer. She was sauntering within these legal precincts, lost in thought; for the spring days revived, with greater vividness each season, the imperfect reminiscence of her childhood; and in the vista of these misty scenes there had reappeared a handsome youth, her companion in sunny fields and shady woods. This youth had now grown into a likeness of Sidney Trench, and she began to associate him with this companion, as though they were one and the same. Could this be possible? One and the same! She had not the courage to question the young lawyer; she dreaded lest he should

destroy by a contradictory word this fanciful image of himself which she had built up from memory in her own mind. She conceived that those sunny fields—more of a dream than a reality—were too far distant from Took's Court ever to be reached again, except in imagination.

Rosa had never become reconciled to this humble life, to which she knew that she had not been born or bred. But her affection for Abel Norris had curbed her impulse to rebel. Was he not always meditating how he could best please her? She had the warmest of hearts, and the old clerk never appealed to her better nature in vain. He had constructed a window-garden in her garret; and when the seeds which she had planted there began to show signs of bursting into leaf, she could not repress her sense of gratitude and delight. She would sit for hours in this garret-boudoir; and she would almost forget for the moment her cravings for a more congenial home. A gleam of sunshine would sometimes linger for a brief half-hour in her 'garden'; though never a ray looked in at the windows below; the old clerk's inky parlour was always in shadow.

Happening presently to look up, the girl caught sight of Sidney Trench. He was crossing New Square and coming towards her. Having met more than once since the evening upon which he had first called at Took's Court, Sidney had naturally been often in her thoughts; not only playing a part in the dreamy recollection of her childhood: she regarded him as their benefactor. Had he not extended a helping hand at the moment when they needed it most? She had frequently wished to express all the gratitude with which her heart was overflowing; for she had meditated and composed many a pretty speech to which she believed that she would have the temerity to give utterance. Fatal deception! Now that he was standing before her with outstretched hand, Rosa had not the courage to utter one word.

He walked slowly beside her within these quiet precincts of New Square. The clock over the ancient Hall had struck six, and the place was comparatively deserted. And now the chirping of the sparrows grew louder; and the retreating rays of the setting sun—that ascended obliquely the weather-beaten stone walls—seemed to increase in brightness.

'Would it surprise you, Rosa,' said Sidney, who felt impelled to address the girl as he had done his little playmate in early days, 'if I told you that I had been making all sorts of schemes about you?'

Rosa looked up laughingly, and said: 'Is not scheming part of a lawyer's profession?'

Sidney smiled. 'It is the way of the world. But I wish, seriously, to consult with you. A lawyer seldom schemes without his client's permission.'

'Am I your client?'

This question brought an odd laugh from Sidney. 'I suppose so. Shall we assume it, for argument's sake?'

'Yes! And then we must suppose,' said Rosa, with a brightening look in her eyes, 'that I've got a great black deed-box at your office, full of documents, with my name'—She stopped, and the colour spread over her cheeks. She

had not reflected when she spoke that 'Rosa' was the only name she could recollect.

'Ah! The deed-box and documents,' said Sidney, as if to reassure her, 'will come—all in good time. Meanwhile, your legal adviser has one or two questions to ask his client.'

Rosa curled her pretty lips half-seriously and half in play. 'Must I submit to a cross-examination?'

Sidney again laughed. 'I merely want to discover,' said he, 'whether my schemes meet with your approval.—To begin, then! Is not this life in Took's Court a little dreary?'

'Sometimes. Yes, very dreary indeed.' Then she added: 'I know how wrong it is to be dissatisfied. Poor old dad is so good: I think he loves me more than he ever did. He thinks that I am quite happy and contented now. I love him too. And yet I sometimes think—but that's only when I'm in a wicked mood—that I shall run away.'

'Where would you run to, Rosa?'

'How should I know? I should stop as soon as I reached the country. Is that very far?'

'No.—Would a country life content you?'

'If there were lots of wild-flowers: that is all I think about.—But,' she added, 'how could I leave poor dad? That would be selfish: it would be ungrateful.'

The young lawyer looked grave. 'My scheme, I'm afraid, would take you from Mr Norris. But you could come and see him whenever you liked.'

'Could I?' said Rosa dreamily.

'Yes.—My scheme is,' said Sidney, 'that you should become the companion to a rich lady who'—

'Does she live in London?'

'No; in the country. But the house where she lives is little beyond the suburbs. There is a large garden, and shady walks, and wild-flowers; and on all sides are open heath and wooded hills.'

Rosa made no reply. If the young lawyer had known all her thoughts—thoughts to which she had never given expression—he could not have touched upon a more genial subject. Could he possibly comprehend her?

It had only been from a strong sense of duty that she had successfully resisted the temptation to leave Abel Norris months ago and accept some situation out of London where she could breathe the pure country air that would remind her of happier days. How she longed to look upon the 'open heath and wooded hills! Would they not revive—did not the very words revive—her memories of childhood? She bent her head thoughtfully. 'What shall I do?' said she in a low voice.

She eagerly desired to confess her craving for such a home. But she thought again of Abel Norris and the lonely life he would lead without her. He had befriended her for twelve years past: he had never ceased to exert himself, for her sake, to find work that would lift them out of their poverty. Some show of gratitude, some sacrifice of her own happiness, was due to one whose self-abnegation, out of love for her, had been so pathetic.

'Take your time,' said Sidney, noticing her hesitation, 'to arrive at some decision. Events

may possibly decide for you; so do not answer impulsively. You would do well to talk the matter over with Mr Norris; and when you have made up your mind—after listening to his view of the subject—you can again consult your lawyer.—What does my client say to that?

'She will follow your advice.'

'Excellent!—And now,' said Sidney, 'won't you come and sit down in the clients' room? Mr Norris is at the office. You can wait there, if you like, and go home with him.'

'The clients' room?' said Rosa with an eager look. 'I should like to see that.'

While talking together, they had wandered out of New Square into Lincoln's Inn Fields; and they now found themselves at the very entrance to Trench, Pilkington, and Trench's office. It had often occurred to Rosa that a peep inside the old house would be deeply interesting; for her curiosity had been roused by all that had reached her ear about the great Mr Pilkington and the wealthy clients who so often grew weary of waiting, like so many doctors' patients, in the octagonal room on the staircase. It was towards this very room that Sidney now led the way. With a certain feeling of trepidation, for which she could not account, Rosa followed. Her first impression, as she seated herself in the chair which Sidney placed for her, was that she had been here before, but not in childhood: at some remote period too shadowy to recall even as she had recalled a half-forgotten dream. It was something so dim, so confusing, that it vanished from her memory when the young lawyer spoke.

He had stepped towards the door leading into Mr Pilkington's room. 'I will tell Mr Norris that you are here,' said he; and before Rosa could answer he was gone.

She now looked about her with eager curiosity. Suddenly her eyes fell upon the deed-box upon which was written 'Rosamond Gage.' The girl sprang from her chair with a suppressed cry upon her lips. She remembered all now. Rosamond Gage was her own name! Sidney Trench had not spoken idly: she was indeed his client. But why had he never told her of this?—why had he left her so abruptly without a word of explanation?

Rosa placed her hand upon Mr Pilkington's door, opened it, and stepped forward. But there was a green baize door beyond, firmly closed: the sight of it cooled her impetuosity. She retreated into the waiting-room in alarm at her own action. Had she thought to discover the secret there? She sank back in her seat, as many a client had done before her, with impatience expressed in her whole attitude. There was no remedy: she must wait.

Sidney Trench, who had a moment before passed into Mr Pilkington's room, was evidently expected there; for the old lawyer expressed no surprise at seeing him enter so abruptly.

Mr Pilkington glanced towards the green baize door. 'Is she there?' He was standing near his desk, leaning one hand upon it, and looking half over his shoulder towards Sidney.

'Yes; she is waiting, sir, for Abel Norris.'

The lawyer turned and came towards Sidney; he placed his hand kindly upon the young man's shoulder. 'Sidney,' said he with great earnestness, 'I spoke harshly to you the other evening in the library; I regret having done so.'

'Why speak, sir, of that now? I took it, as you intended I should, as the advice you believed I needed.'

Mr Pilkington looked anxiously into the young man's face. 'You do not doubt, Sidney, that I love you as much as if you were my son? I was vexed—deeply troubled, that evening. The thought had taken hold of me that you, whose frankness no one could question, had become secret like myself. I viewed the situation with horror; I could not look at it calmly. And yet, no sooner had you left me than I saw plainly the cause: it was my own evil conscience at work. You were keeping no secret from me. It was I who feared being questioned—it was I who was hiding a secret from you!—But we understand each other now: do we not? It was I who needed the advice I gave so freely. I will profit by it, if not yet too late.—Where is Norris?'

'In my room.—Will you see him?'

'At once,' said the lawyer, seating himself at his desk. 'Will you send him to me?'

Sidney found Abel Norris in his room downstairs waiting his return. 'Will you step upstairs?' said the young lawyer. 'Mr Pilkington wishes to see you.'

'Mr Pilkington, sir?'

'Yes. His room is at the top of the staircase: the door on the left-hand side. Mr Pilkington wishes to make your acquaintance.'

Norris, who had never seen the great Mr Pilkington, though he had made several visits to Sidney Trench, felt a certain awe of the senior partner. Nor was the old clerk alone in this respect; many a client had experienced the same disrelish for a private interview. Norris stopped half-way on the staircase and took a pinch of snuff to steady his nerves, and then hastened to knock at the senior partner's door.

Norris found himself in the oblong room. Still at his desk, with his white head bent over some papers, sat Mr Pilkington. He did not raise his eyes; but a stern expression came over his face, as if to hide some possible sign of emotion. 'Your name is Abel Norris?'

The old clerk bowed his head.

'Sit down.—No, no,' said the lawyer, as Norris took a seat near the door. 'Bring your chair close to my desk—closer still. I cannot see you at that distance.—Do you remember me?' he added, abruptly raising his head.

Norris sat down within a respectful distance of Mr Pilkington, on the edge of a chair, and looked at him hesitatingly at first; but gradually a change came over the old clerk's expression; he half rose from his seat, and bending eagerly forward exclaimed: 'Good gracious, sir! Why, I thought of you as dead.'

'Ah!' and the old lawyer flashed a look at Norris under his eyebrows.—'So, you do remember me?'

Norris still continued to examine Mr Pilkington's features. 'I cannot be mistaken. It's twelve years ago,' said he. 'But how could I forget you, sir? How could I forget your face—or that day?'

Mr Pilkington seemed from his manner to be demanding 'What day?'

Norris understood him. 'That day,' he hastened to explain, 'on which you came to our

cottage near St Albans and placed a little girl under my wife's care.'

Mr Pilkington leaned back in his chair. But he neither glanced up nor made any answer.

'Why, sir—why did you never write to me?—Did you think,' said the old clerk pathetically, 'that she was dead?'

This question brought a quick and somewhat angry retort. 'What does it matter to you,' said the lawyer, 'what I might think? It will not alter the situation. The girl is alive and well: is she not?'

'Yes; she is alive and well.'

The lawyer reflected a moment. 'Has she any recollection of me—any impression of her life previous to being placed with you?'

Norris looked earnestly at Mr Pilkington. 'So strong a recollection of you, sir,' said he, 'that were she to meet you now—though it is twelve years ago—I doubt not she would know you again. She has a wonderful memory.'

Mr Pilkington grew still more thoughtful. 'We shall see,' he muttered—'we shall see.' While speaking, the lawyer slowly rose from his chair and walked towards the green baize door. Norris rose also and stood watching his movements with curiosity. Mr Pilkington, without inviting the clerk to follow by sign or glance, stepped into the octagonal room.

Abel Norris was puzzled. What was Mr Pilkington's object in quitting the room so suddenly? He had left the door ajar; and the old clerk could not fail to hear the sound of voices. Was that Rosa's voice? Norris went towards the door with eager outstretched hand. Something impelled him: he passed through, and stood with the further door wide open before him. The dusky light was looking in at the little barred window in the octagonal room; Abel Norris saw Rosa half kneeling at Mr Pilkington's feet and clasping his hand in both her own. 'My dear,' the old lawyer was saying in a firm though kindly voice, 'we must have no tears, if you please.'

QUARANTINE.

QUARANTINE, as the isolation of infected shipping is termed, is by no means an institution of modern growth, inasmuch as its origin has been traced to the fourteenth century, when laws enforcing it were promulgated by a Council of Health at Venice. These restrictions, so onerous to the shipping community, were introduced for the purpose of preventing the importation of infectious diseases by crews and passengers of ships arriving from unclean ports. It was in the first instance supposed that a period of forty days ought to elapse between the date on which a vessel set sail from a suspected seaport and that on which those arriving in her might land at any other place without endangering the health of the inhabitants. The term quarantine itself is said to be a corruption of an Italian word meaning forty. In Pepys' *Diary* there is an entry, dated November 26, 1663, to the effect that the spread of the plague at Amsterdam was the cause of all ships coming

thence being compelled to perform a quarantine of thirty days.

In recent times, the period of close surveillance varies with the exigence of each case, as set forth in a vessel's bill of health, which is a document bearing the signature of a consul or other competent authority of the port she last left. The interval of compulsory seclusion is sometimes only two days, but, under exceptional circumstances, may be prolonged indefinitely. Publication in the *London Gazette* of the Order in Council declaring quarantine to be enforced against ships arriving from specified ports is deemed sufficient and satisfactory notice in this country to all concerned; but shipmasters are otherwise well informed, and ignorance is no excuse for evasion of the regulations.

The provisions of the Quarantine Act, which received the royal sanction in 1825, gave almost unlimited power to the authorities to place obstructions in the way of the importation of epidemics by shipping. Ships could be detained at their moorings with passengers and freight for such time as the Privy-council might consider necessary. The Public Health Bill of 1872 endowed the local sanitary authorities with power to make visitations from ship to ship on a similar plan to that pursued with respect to shore-structures. They fumigate vessels with sulphur and charcoal, isolate the sick either afloat or on shore, let the healthy depart about their businesses, and disinfect or destroy all articles of apparel and bedding which may be presumably infectious. All woodwork is carefully scrubbed with diluted carbolic acid and in most cases repainted. Customs' officers have somewhat similar powers; but they have to give notice to the sanitary officials, who at once take the necessary steps to minimise the danger. Perfect quarantine is almost impossible; and imperfect isolation is worse than useless, as it does not effect the desired end, and only tends to disarrange the carrying-trade of the country. The new system seeks to substitute sanitary inspection, giving a maximum of safety with a minimum of inconvenience, for an irrational quarantine of indefinite duration and uncertain result.

Cholera, yellow fever, and the plague are the three principal evils against the spread of which quarantine is specially directed. Since the Great Plague, which Daniel Defoe has described, this pestilence has not visited our islands. In 1879, however, immediately the plague was supposed to be in Russia, the continental nations adopted the old rule, and subjected all vessels coming thence to a quarantine detention varying from twenty to forty days. Yellow fever has its breeding-places in the West Indies, the southern parts of North America, the north-east districts of South America, and the west coast of Africa between ten degrees north and fifteen degrees south latitude. It requires fairly hot weather for development, and cannot thrive where the temperature is below seventy-five degrees Fahrenheit. It has reached this country several times,

but is an exotic. Southampton being a West India packet station is liable to occasional importations; and Cardiff had it about thirty years since, when the advantage of modern sanitary supervision over old-fashioned quarantine was most marked.

In the end of June 1889, the dread of yellow fever had caused most stringent quarantine to be enforced by the United States government against all arrivals from Brazil and other fever-spots. Some ships had been refused entrance on any terms; and editors of shipping journals were constantly being asked whether under these circumstances a shipowner might throw up his charter and send the detained ship seeking for cargo elsewhere. Officials over there have demonstrated that yellow fever may be restrained within bounds by completely isolating the sick; that strict sanitary precautions limit the severity of an attack; and that a fall of temperature is followed by an immediate decrease in the numbers attacked. An international system of sanitary surveillance over arrivals from all ports is, in their opinion, the only practical means of preventing the spread of an epidemic from port to port. Cholera was in Europe in 1873, and actually made its appearance in London, but was skillfully eradicated by the sanitary authorities. Besant and Rice, in one of their realistic novels, bring in a chapter on the cholera at Palmiste. Two coolie-ships entered the port with cholera raging on board, and were sent to perform quarantine at an anchorage some twenty miles distant. News shortly came that the English officers and seamen had succumbed, and the coolies were dying uncaared for by any one. A young army surgeon volunteered to go out and remain with the stricken ones. Certain death seemed to await him; but his heroism was rewarded by the saving of the lives of half the Indians and the retaining of his own health.

Our own experience of quarantine has been gleaned under many skies, and we quite agree that 'Cælum, non animum, mutant qui trans mare currunt.' There is always a disposition on the part of a shipmaster to dish the sanitary people. About twenty years ago we were making a passage in a sailing-ship laden with currants and rags, bound from the Ionian Islands to New York, when persistent head-winds compelled us to anchor in Gibraltar Bay, and there await a more favourable opportunity for proceeding through the strait. A health-officer soon came alongside, and administered interrogatories to our commander, which elicited replies that seemed a studied suppression of the truth. Our clean bill of health had been mislaid, and we were rightly looked upon with suspicion. Some of our documents were read by the officials seated in their boat, who exercised great caution lest, inadvertently, contagion should be communicated by contact with our harmless-looking manuscripts. Each sheet was taken from us and grasped by means of a long pair of tongs, then placed in a box containing disinfecting powder, and after much motion therein, withdrawn to be read at arms-length. This part of the programme being completed, all hands had to appear at the ship's side, so that our visitors might count polls, in order to make sure that every one was in good health whose name appeared on the crew-list furnished them. All would have gone well,

but for a little accident. A seaman had joined at Patras, whose name had not been placed on the articles of agreement. He, however, was on view with the others, as this discrepancy had been provided for by concealing a Maltese boy. The temptation to have a sly glance at his strange surroundings proved irresistible to the dark-skinned youth, and while hurriedly gazing, he was promptly noticed by the men in the boat alongside. We were at once ordered to hoist up a yellow flag at the fore, as a warning to all around that we were quarantined, and strictly forbidden from landing or going on board any of the ships at anchor near us. Shore-boats brought off fresh provisions to us, and we were not precluded from lowering a boat into the water and rowing round the shipping to have a chat with those we knew. This doctor's visit—or giving *pratique*, as it is termed—is often a nuisance to business men, who may have the supreme pleasure of seeing their train steaming out of the station while awaiting a dawdling *pratique* boat. It is almost unnecessary to add that the native of Malta soon suffered much bodily pain in consequence of his curiosity.

A second experience of quarantine was far less irksome; in fact, it was a delicious reprieve from hard labour. Having arrived at St Thomas, West Indies, during a sickly season, when the population of this Danish dependency were decimated by yellow fever, it was but natural that several of our seamen should be carried off by this terrible visitant. Sailing thence, we reached the Cuban port Guantamano, where the Spanish-speaking pilot declined boarding the vessel, but directed her movements from his skill, towing astern. As she passed a large fort situated at the entrance to the harbour, a military officer hailed us; and on learning whence we came, was good enough to order us forthwith into strict quarantine at a remote anchorage for twenty-one days. There had not been any sickness on board during the passage, so that all danger having passed away, we were able to spend a most enjoyable three weeks. Ballast was furtively heaved overboard; and after all had been prepared for taking in cargo at the expiration of our period of seclusion, those who felt so disposed made daily boat excursions up limpid fresh-water streams meandering beneath leafy canopies formed of graceful creeping plants, which had somehow drifted across from tree to tree on either bank, and intertwining their foliage, almost shut out from view the azure vault of the tropical heavens. We could, however, have dispensed with the predatory mosquitoes which hummed unceasingly. We were sorry when the time came round and we hauled into the wharf to load sugar for Philadelphia.

Smallpox in its most virulent form was ravaging the filthy Chinese quarters of San Francisco, California, and many white residents were similarly suffering when we passed out of the Golden Gate bound for an Oregon timber-port. All hands seemed in robust health; but we had scarcely lost sight of the well-known landmarks when one, and he an utter stranger, fell ill with this loathsome disease. No sick quarters existed, as in a man-of-war, so that the poor fellow in his delirium crept into every sleeping-place in the seamen's house on deck. A noble-hearted shipmate, when it was his watch below, cleansed and fed the

doomed man, who was missed one day in the absence of his unpaid nurse, and subsequently found dead with his head jammed into one of the hawse-holes, whither he had crept in his last agony. Sewn up in the remnant of an old sail, his body was hurriedly cast into the deep without even the semblance of a religious ceremony. That afternoon we dropped anchor at our destination.

Like many another self-styled city in remote settlements of the United States, Empire City consisted of not more than a dozen wooden edifices, including the sawmill where all the citizens worked. Health-officers and *pratique* were unknown in this out-of-the-way spot, and our captain fondly hoped that having got rid of the corrupted body, he could keep the people on shore in blissful ignorance of the event. A boat came alongside from the mill to give us information respecting our cargo. The vessel being a regular trader, our crew and the shore-gang fraternised. Jokes and laughter were prevalent, until one of the newcomers asked if smallpox was still on the increase at San Francisco. 'Well, I guess so,' drawled out a down-cast Yank, 'for we have just thrown over a very bad case outside the bar.' His words resulted in a stampede, and the deck was cleared of strangers almost in the twinkling of an eye. They pulled away for the wharf, and soon returned with an intimation, couched in strong terms, that the vessel was to remain at her anchors for fourteen days, and no communication allowed with the shore. The mill-hands had a wholesome dread of smallpox; and although there were no powers to enforce their commands, yet the fear of recourse to Judge Lynch was equally deterrent to our captain. Our owners grumbled at the detention; but the loss was nothing in comparison with that suffered by having a large steamship stopped, such as the *Neva*, lately quarantined at Southampton. Capital lies idle, and extra expenses are incurred the whole time of quarantine. In November 1877, Sir Donald Currie's *Taymouth Castle*, having had a case of smallpox during her passage out, was kept in quarantine, with a goodly number of passengers on board, for twenty-one days at the Cape. It is no small expense to cater for the modern steamship passenger.

Eminent authorities affirm that the prolonged detention of the sick and the healthy on board an infected ship often fails to attain its supposed effect. It is a well-established fact that fear predisposes persons to infection; and being shut up in the same ship with dying fellow-creatures is not conducive to strong nerves and longevity. The yellow quarantine flag which must be displayed at such a time serves the purpose of the red cross on the houses during the Great Plague. Continental ports are very strict with arrivals by sea, but altogether lax in their treatment of persons coming overland from infected places. A British ship went from Genoa to Sestri while the cholera was raging; but on arrival at the latter place her master was not allowed to land. Her cargo came off in lighters; and when laden, her master went back to Genoa by steamer, thence to Sestri by rail, where he was well received by the very people who refused to have any communication with him by sea. This is one of the anomalies of continental quarantine, as wittily related in one

of Mark Twain's works. It is probable that in this country quarantine will only be enforced in future for yellow fever, cholera, and the plague, and then in a much modified form.

A NIGHT'S SPORT IN CASHMERE.

BY AN OFFICER'S WIFE.

WE were making a tour in Cashmere for pleasure and relaxation, after many months of hard work in a hot and dusty station, and had decided not to make the search for game our first object. Those who have done the latter know how fatiguing the chase is apt to be for travellers with limited time and limited health at command. The yearly increasing number of English visitors bent on sport, and the consequent activity of the *shikaris*—or huntsmen who are expected to find and report the quarry—are driving the larger animals farther back into their mountain fastnesses, so that long and arduous journeys must often be taken to follow them. Many of the lower ranges where the magnificent markhor were once common are now quite deserted by them; and the goorul, ibex and ovis ammon are becoming equally scarce. We resolved, therefore, not to attempt the pursuit of any of these wary creatures in the short leave at our disposal, but to wander about in an easy and leisurely fashion, merely taking such chance of occasional sport as might come in our way.

So we had done more sight-seeing than shooting. We had been towed by our boatman and his family up the river, lying in restful luxury in our thatch-covered boat, and remarking at intervals on the delicious contrast between this calm coolness and the heat and worry and fret of life at Ghurrumpore. We had glided under the hanging balconies of Srinugger, the Venice of the East, and had looked down from the little hill above the city called Solomon's Throne upon the windings of the Jhelum, stretching serpentine and silvery through the verdant plain—the windings which are said to have given the first idea of their famous pine pattern to the Cashmere shawl weavers. We had visited the crazy wooden galleries where these weavers, or rather embroiderers, sit stitching exquisite designs into shawls for the Queen. We had seen the caves of Boomzoo with their rush of myriad bats; and the tanks of Bawan, where the sacred fish have been so allowed to accumulate that the water will no longer cover them, and when the priest approaches to feed them there rises from the basin a solid mass of writhing coiling horrors, which look more like snakes than fish, for they are of a long-shaped scaleless kind and all black. We had seen Avantipore and Martund and many other splendid ruins; had shot wild-duck on Lake Woolar and snipe at Manusbal; and without leaving our route had met with two bears and a stray barasingh, and added their skins to our trophies of former days. When I say 'we' in this case, I mean, of course, that my husband, whom I will here call Tom, shot the game, for although always much interested in his exploits, I had never killed anything larger than a scorpion.

We had now reached a beautiful glen near the

entrance to the Naoboog ravine, and pitched our tents in a grove of walnut-trees, meaning to move on quietly up the valley, where *barrasingh* or stags were reported to have been seen. The shikari, who, notwithstanding our resolve, was an energetic and important member of our following, went into the nearest village, after his custom, to ask for news of game, and came back much elated with tidings that a large panther was in the neighbourhood, had become very bold by reason of impunity, and was scaring the villagers every night with its undesired visits. It seemed at once a duty to rid the poor people of this pest, and a fortunate thing that Tom had arrived in the nick of time to do so. Further inquiries elicited the direction from which the panther generally approached and other particulars of its raids; and the shikari was despatched to survey the ground and make preparation for a night attack. He was absent all the afternoon, and returned towards sunset, saying he had found a tree at a bend of the nullah down which the panther would certainly pass to reach the village, and in this tree he had constructed a small *maichan* or shelter of branches, where the Sahib might lie in ambush to await the foe. There was a stir of excitement all through the camp, the servants eagerly discussing the shikari's arrangements and adding advice of their own with hearty wishes for the Sahib's success and the death of the common enemy. I caught the infection; and disliking the idea of being left alone in camp while this attraction was going on close by, I asked—at first doubtfully—if I also could not be accommodated in the *maichan*. The all-powerful shikari at first demurred, but in the end was graciously pleased to consent, reflecting that as the tree was in full leaf, I should be well concealed, and my only care need be to sit monumentally still.

Delighted with this concession, I arrayed myself in a plain dark costume; and when night had fallen, we set forth from camp in solemn order. Never shall I forget that walk. The night was dark and moonless; thin clouds drifted over the faint stars, sometimes obscuring them altogether, and a light gusty wind made the place seem alive with fancied shapes and moving shadows. The shikari went in front, to show the way, carrying in his coat a wretched pariah puppy, that must have been half-strangled and half-smothered by his effectual suppression of its yelpings. Tom and I followed, but tried in vain to imitate the man's soft catlike tread over the broken ground. There was no sign of a path, and I confess I longed for a lantern as we groped along, stumbling over boulders and tearing our clothes on cactus thorns and running momentary danger of treading on a sleeping snake. From the moment of our start not a word was spoken; we progressed in perfect silence, save for the sound of our cautious footsteps; and the way seemed so long and so rough, I was tempted to wish myself quietly in bed. To return, however, was impossible; and at last, to my relief, the shikari signed to us that we had reached the tree. He left us standing at its foot for a few moments while he advanced to a tent peg which he had previously driven into the ground some twenty paces from the tree, and to this he tethered the reviving puppy. Released from his repressive control, the little beast at once began to howl dismally after

its kind, and I verily believe it was then as happy as any pariah can be out of sound of its howling brethren.

The next step was to climb into the tree, and this proved an easier task than I had expected. There was a low branch to which Tom clung while he drew me up towards him: the *maichan* was not at any great height from the ground, and with some further assistance, I was soon safely lodged in it. From the accounts I had read of these structures, I expected to find a sort of open platform; but it was in fact more like a semi-circular nest, the side of which formed a thick leafy screen. Tom stood on the strong bough supporting it with his rifle resting on a higher branch, its muzzle covering the dog. I crouched at his feet and looked out through a gap in the side of the *maichan*, while the shikari wedged himself into a fork of the tree close above our heads. And now began a long trial of patience. The night wore slowly on, and we saw no trace of the panther. The wind, which had been moaning drearily, died away, and a strange stillness descended on the world. The rustling leaves hung straight and motionless, the soft noises in the wind-swept grass became hushed, and even the small insect voices all around ceased to chirp and grind. We did not dare to change our positions, and hardly felt the cramp they occasioned. It seemed to me the whole region was listening intently, and straining towards a sound which did not come; and for a long time 'the beating of my own heart was the only sound I heard,' except, indeed, the constant howling of the pariah, which fell like the wail of a spirit in prison upon the silent night. I am confident the creature heard in his imagination the melancholy cries of his friends in the far-off village, and felt constrained to do his friendly duty and answer them while he had a breath left, as he wandered up and down at the length of his tether; but his laments did in fact attract a very different auditor.

The clouds, though filmy, did not disperse, and the uncertain starlight that filtered through them only allowed us to descry dimly the white body of the restless dog. I feared that when the moment arrived, Tom would be unable to see where to aim. My own excited fancy kept me trembling with eagerness and false alarms. A dozen times I thought I heard a stealthy step approaching down the nullah; once I felt sure the panther was climbing into the tree; and when a little sleepy bird fell off its perch and fluttered down amongst the branches, I started so as nearly to fall off my own. That, however, was my only transgression in the way of movement; and then again for an hour, that seemed like six, we remained as motionless as lizards on a sunny wall. I then became persuaded the panther had taken a different route and we should see nothing of him that night.

At last there was a change. The pariah ceased howling, retreated to the farthest limit of its string and cowered shivering on the ground. A silence that might be felt now fell around; not the slightest whisper broke the stillness. I thought the little beast had at last made up its mind to seek a little well-earned repose, and this I regretted, because the quietude, oppressive before, had now grown almost insupportable. But suddenly I became aware that the panther was

there, a stone's throw from the dog. Its velvet foot-pa, quite inaudible to us, had been accurately measured for some moments by the terrified puppy; and now its large dark form, vaguely to be discerned against the ground, was creeping stealthily nearer. In breathless horror I watched it, not daring to distract Tom by the slightest sign, and yet consumed with fear that he might fail to see it, or aim wrongly in the deceptive light. The end came soon. A scarcely perceptible signal from the shikari, a flash and report from Tom's rifle, and then the most unearthly yell that ever fell on mortal ears. There was a bound of the dark body through the air, then a heavy fall, and then for the first time one of us spoke. 'Well done, Sahib!' exclaimed the shikari in exultant tones. 'You have killed him.'

But Tom was cautious, and bade the man not descend till they were more sure his single shot had proved effectual. There was no movement, however, in the fallen mass; and at last they both got down from the tree and approached it with loaded weapons. The panther was quite dead; the bullet had penetrated its heart, and death must have been instantaneous. Tom had hit it just in the act of springing, when its breast was exposed, and it had fallen right on the top of the unlucky dog. The shikari assured me that the fearful yell we had heard proceeded from this animal, and not the panther, which must have dropped like a stone without a gasp. I have no opinion on the point myself, as the sound seemed to me utterly unlike all possible cries from either of those creatures.

The dog was extricated with some difficulty from its dreadful situation, more dead than alive; and I am sorry to say the shikari was for turning it adrift then and there, it having served our purpose. But this we would not hear of, and insisted on his carrying it back to camp, whence it was duly restored next day to the congenial company of its mournful fellows in the village, with which it doubtless exchanges piteous salutations to this day.

Our walk back seemed short and easy, since we were allowed to talk and use Tom's pocket lantern; and the panther's beautiful spotted skin—a very fine one—made an ornamental addition to our mementoes of Cashmere.

WANING DAYS.

BETWEEN the glowing beauty of the short-lived 'Indian summer' and the dull sharp cold of the final setting-in of winter there are frequently a few days of a distinctive character, that have a sober charm attached to them, unlike any other time of the year, when 'Autumn, like a faint old man, sits down by the wayside weary.' Not like the warm humid mistiness of the atmosphere incidental to the waning of the September harvest moon, or the crisp clear frostiness seen in the sharply defined clouds and orange sunsets of mid-October, that presage the fitful storms of rain and sudden gushes of wind that have stripped the forests of their richly tinted foliage, and spread a thick carpet of russet and gold at our feet. But rather as if Nature, having 'borne the burden and heat of the day' from seedtime till harvest, was at last content to rest for a short season in utter

peace and silence; when the short darkening days are so full of grave quiet, so colourless and voiceless as to wear an almost sullen aspect; when the few belated yellow leaves flutter noiselessly to the earth, and wreaths of vaporous exhalations rise from the low-lying valleys, and float sluggishly away over the bare stretch of hills and fields of stubble, moving about like disembodied spirits 'haunting the dying days' of the year.

Sometimes in the early days of February there comes one of these sullen misty days during a sudden thaw; but though nearly akin, there is still a subtle difference to be felt in the air, when the very blades of grass seem instinct with a faint thrilling breath of spring-life. But in the soft brumal days of early November, before the sun has pierced the mass of vapour, the cobwebs hang in thick clusters over every leafless hedgerow; they cover with a filmy network the interlacing branches in the copses and thickets, and lie in long trails over all the grass and stubble. Everything looks dim and mysterious in the haziness over surrounding objects, both far and near.

During the mid-day hours there is a sudden change: the rolling mists clear away imperceptibly; the slanting sunbeams shine through the bare branches of the trees with faint gleams of pale yellow light; and it becomes very pleasant to stroll into the lanes and along the more sheltered hedgerows. A gentle wind sighs with melancholy sound through the aspens and poplars; the intricate tracery of ash and elm is defined against the misty blue of the sky. The decaying foliage sends up 'a moist rich smell of rotting leaves,' as the feet sink deeply into the heaps of dun, russet, and brown. The oaks still retain most of their rich tawny leaves, through which the light wind rustles sadly and fitfully. Along the bare hedgerows in sheltered corners still hang the fluffy white blossoms of the sweet-scented 'traveller's joy.' Here and there are later trails of blackberries, with some ripe luscious fruit still worth picking; and heavy heads of elderberries hang limp and black. Great boughs of crimson haw show brilliantly when they catch the lowering sun; a tangle of nightshade has its scarlet-orange berries in wild profusion contrasted picturesquely against the dark glossy green leaves of the ivy; farther along, bunches of 'pale-faced yarrow' gleam amongst the russet-brown and crimson ling; yellow hawkweed flourishes amongst the thick tufts of rank hummocky grasses; and across the corner of the common the wild barrenness of the scene is lighted up with patches of golden gorse, those 'lights set upon a hill,' the 'bonnie gorse,' that braves wind and weather from Land's End to John o' Groats.

How still and sweet the air is; and so pleasantly warm, that the frost has hardly touched, in this sheltered lane, the low-growing plants; and the pungent scent of wild thyme directs the eyes to the busy ant-hill, where, blooming in fragile loveliness, is a bunch of harebells.

Through a gate in the hedge are the beech-woods, where the air always seems warm and dry, and the short fine grasses grow luxuriantly. The hills and hollows are full of brown-leaves that have long fallen, and amongst which the busy squirrels are sorting out the nuts to store for winter, instinctively picking out the sound ones, and rushing away with sharp warning laugh

when observed. The cushat doves still 'Hoo, hoo' amongst the branches; and the sharp 'Pink, pink' of a flock of chaffinches startles as they take sudden flight from among the berried hawthorn hedges. You catch a glimpse of the gleaming golden-brown wings and brilliant blue-green neck of a cock-pheasant hovering in the lower branches of a tree; and a covey of brown partridges steals through the undergrowth to the clearing, where they suddenly rise with swiftly whirring wings and fly across the stubble-fields. The pretty creatures have a brief respite, for to-day the sportsmen are engaged some distance off, and the reports of the guns are but faintly heard in the far-reaching woods.

Among the low-growing shrubs and brushwood the hares scuttle nervously into hiding; and the rabbits scurry about in all directions at the sound of a strange footstep amongst the heaps of leaves. Standing quietly near the clasp-gate, the clear sweet notes of that winter songster, the robin, trill out pleasantly from his perch on a lichen-covered tree-stump, from the decayed root of which springs a cluster of bell-shaped ash-gray toad-tools. Under the plank by the gate flows a bright little streamlet; amongst the smooth-worn pebbles are still a few pale-blue forget-me-nots; and long trails of 'creeping jenny' with bright yellow blossoms here and there. A little farther along, the brown reeds and sedges rustle with a whispering sound of brown foaming water, where it whirls and eddies round the corner of the woods towards the mill-stream. Just round there the banks are deep and thick with moss and lichens; and here grow huge bunches of hartstongue ferns, with their long glossy-green leaves bending from either side of the narrow stream till they intermingle and hide the rippling water from view.

But the sun has wandered towards the horizon, and shines through the rapidly thickening fog with but feeble lustre; and there is a sudden raw cold in the atmosphere as you hasten from the side of the mill-stream into the high-road again, and in the growing twilight, walk as speedily as possible towards home, where the brightly dancing firelight gleams through the crimson-curtained windows with a cheerful welcome.

'WORK DONE' BY MOUNTAINEERS.

A most interesting calculation has been made by Dr J. Buchheister on the 'work done,' or physical force spent, by persons in ascending heights. Supposing a mountaineer weighing twelve stone, or 168 pounds, is ascending a summit 7000 feet high from the point of starting, he has to expend an amount of physical force found by multiplying his weight by the height to be ascended; in the case assumed, a weight of 168 pounds \times a height of 7000 feet = 1,176,000 foot-pounds; or, in other words, 1,176,000 pounds have to be lifted one foot, or one pound has to be raised 1,176,000 feet. This is work performed by the muscles of the legs; but, besides this, the contractions of the muscle of the heart have to be taken into account. Its function consists, as is well known, in propelling the blood collecting in the heart, on the one hand, into the arteries, and, on the other, into the lungs. This is effected at an estimated initial velocity of a foot and a

half per second, which represents, in the case of an adult, a work of rather over four foot-pounds for each contraction of the heart. The pulsations of an adult are, on the average, seventy-two per minute; but in ascending heights, owing to the additional exertion, their number is increased to an extraordinary extent. Assuming, for the sake of simplicity in calculation, only 100 beats of the pulse per minute, this would give 400 foot-pounds per minute, 24,000 foot-pounds per hour, and 120,000 foot-pounds for the five hours supposed to be required in ascending a height of 7000 feet. The work performed by the muscles in breathing, by the expansion and contraction of the chest, may also be estimated at four foot-pounds. Further assuming that the number of breathings per minute is, on the average, only twenty-five, although, as a matter of fact, it will be found to be higher in a mountain ascent lasting five hours, we have to add further work of 30,000 foot-pounds. The total work performed during five hours by a mountaineer consequently amounts to 1,326,000 foot-pounds. In this estimate are not included the physical force spent in overcoming the friction on the ground, the exertions to be made in keeping the body erect at dizzy heights, and in dragging heavy boots and foot-irons, nor the loss of muscle power in cutting steps in the ice, not to reckon the work performed in carrying an ice-axe, or the physical force exerted in crossing fresh, loose snow. Taking all these conditions into account, Dr Buchheister arrives at the conclusion that the work done by a mountaineer in ascent of 7000 feet, lasting five hours, cannot be placed at less than 1,380,000 foot-pounds.

HER FAULTS.

I know she has a score of faults;
Ah, count them o'er to me,
And if by chance your memory halts,
I will your prompter be.
Her faults, I own, the worldly wise
Must ever loudly blame,
Though it may chance to spirit-eyes
They bear another name.

So frank she will the truth attest
Though it be ill received,
And ready she to think the best
Though constantly deceived:
So prompt the absent to defend,
She oft but idly pleads;
So loyal to a stricken friend,
For self she little heeds.

All careless of the world's applause,
Unless 'tis fairly won,
She judges of another's cause
As if it were her own.
I love her for such faults as these,
And own the reckoned score;
And that she loves me, you may please
To count as just one more!

THE JENOLAN CAVES OF NEW SOUTH WALES.

CAVES are common in all countries where limestone rocks abound, and caves of some kind and dimensions are doubtless familiar to everybody. The most famous caverns of the world are the Grotto of Antiparos of Greece, the Adelsberg Caverns of Carniola, and the Mammoth Caves of Kentucky. All these have been frequently and fully described by various travellers; and tourists are tolerably well acquainted with the subterranean wonders of the limestone regions of our own country, in Derbyshire, Yorkshire, and Somersetshire. But comparatively few people in the colonies, and still fewer at home, are acquainted with the wonders of the Cavern region of New South Wales, the extent of which rivals that of the Mammoth Caves of Kentucky. An Australian writer, Mr Samuel Cook, has recently published a descriptive account, with photographs, of what he calls 'Australian Wonderland,' and we shall avail ourselves of his guidance.

But first, what are caves and how are they formed? They are not necessarily confined to limestone strata; but it is in limestone that the most beautiful and extensive examples are always found. They are also the most interesting by reason of those wonderful freaks of nature called stalagmites and stalactites.

Limestone is soluble in water, and that is the whole secret of the formation of caverns. The rain penetrating through the upper crust reaches the rock, and dissolves some portion of it. Through the crevices, the water has continued to percolate for countless ages, enlarging, multiplying, and beautifying tunnel after tunnel. But it has done more. While wearing away the strata, the water has also saturated itself with carbonate of lime, which it carries along until forced to re-deposit some of it. The passage of air through the caverns causes evaporation and consequent deposit. This deposit may be added to drooping portions of the roof, and thus form stalactites;

or to risings from the floor where a drip takes place from above, and thus form stalagmites.

In short, caverns, and the beautiful columnar and other devices found in them, are simply the result of a natural process of removal of particles of limestone from one place and their re-precipitation in another. 'Caverns,' says Dr Brande, 'originate in crevices formed by the irregular fracture of the rock. Out of these hollow spaces are concocted, by the action of running water, natural chambers of all dimensions. Into these hollow spaces, again, are packed away the most fanciful and singular examples of Nature's handiwork, imitative as it were of human devices. Columns, pilasters, churches, sculptured groups of men and animals, organs, curtains, and almost all conceivable objects, are found or fancied by those who thread the narrow passages or cross the lofty walls with a few glimmering lights to guide them on their way.'

So much for the general, and now for the particular. The extensive series of caverns in New South Wales, now known as the Jenolan Caves, were formerly called the Fish River Caves, although why so is not very evident, since they are some considerable distance from Fish River. They were, however, discovered by a squatter of the Fish River district, a man called James Whalan, who had been robbed by a notorious bushranger called M'Ewan. Following up the trail of this desperado, Whalan tracked him to his lair in the very centre of the wonderful area now called the Cave Reserve.

This was in 1841; and although it is probable that the caves had been known to and used as hiding-places by other outlaws, Whalan was the first to bring them into public notice. The name of M'Ewan, the bushranger, was given to the creek on which the caves are situated, and these last were collectively called the Fish River Caves down to 1884, when the government of the colony officially changed the name to the Jenolan Caves. Some twenty years previously, the area of the caverns was 'reserved' by special decree, and taken in charge as public property under a Cave-

curator, whose duty it is to explore the recesses as yet unmeasured, and to conduct visitors over the known portions.

The area thus properly protected is about six and a quarter square miles. To reach it from Sydney, one has to go by rail some one hundred and twenty miles over the famous Blue Mountains to Tarana, a small township, some two thousand five hundred and sixty feet above the level of the sea. From Tarana to the caves is a distance of about thirty-five miles, partly through an agricultural district and amid fine scenery, and partly through the primeval bush, still the home of the opossum, the wallaby, and the bandicoot. The road rises to a height of four thousand three hundred and sixty-five feet, and then descends suddenly, and by sharp zigzags, some two thousand feet down the mountain-side until the mouths of the caverns are reached.

The portion of the limestone dike in which they are found runs six miles north and south, and the two principal 'day caves'—that is, those which open to the light of day—run right through the mountain east and west. The first of these, called the Grand Arch, is about one hundred and fifty yards in length, sixty to eighty feet high, and from seventy to two hundred feet wide. It is described as gloomily impressive and awe-inspiring, with walls varied by many peculiar rocky formations. On one side is a mammoth lion in stone. Other formations are called the 'Pulpit' and the 'Organ Loft.' One recess is called the 'Bacon Cave' because the rock-formations resemble 'sides' and 'fitches' of bacon. The roof appears covered as with rich bold tracery, and from it depend enormous honeycombed masses of limestone. Branching out from this Arch are caves of various depths, forming a succession of rocky halls in which millions of wallabies have made their homes for ages. The floors of the caverns are thick with their debris. In the 'Organ Loft' there is a fine formation of stalactites and stalagmites by way of organ-pipes, tapered with remarkable grace. Near the eastern end of the Grand Arch is a spot where the water bursts out of the ground in a sparkling fountain of considerable volume, and rushing down a rocky defile, leaps into a deep pool, and thence finds its way through the Nepean and the Hawkesbury to the ocean.

The other great daylight cave is 'the Devil's Coach-house,' an immense cavern, lighted from the roof as well as the sides. At a height of two hundred feet in the roof there is a large orifice fringed with trees, which gives it a fine effect. The floor is strewn with blocks of black and gray marble, and the walls are partly composed of black marble with white veins. The roof is fringed with stalactites, as are also the sides of the entrance, and in several places there are stalagmites covered with projections like petrified sponge. Pellucid drops at the ends of the stalactites illustrate the process of formation. Some of them are said to be twelve to fifteen feet long, and they are in many beautiful hues—shades of blue, salmon colour, delicate lawn, gray, and white. As the rocks are decorated with many-toned patches of moss, the whole arrangement of colour in this cavern is wonderfully beautiful—combining a series of Nature's lessons in the art of decorative design.

The interior caverns of Jenolan are called col-

lectively the 'night caves,' because they can only be inspected by artificial light. They are both the most numerous and the most picturesque of the series.

To reach the first of these, the Nettle Cave, involves a climb of some one hundred and seventy feet from the Grand Arch, and then a descent through a funnel-shaped opening resembling the mouth of an extinct volcano. A slip on this perilous descent would shoot the explorer a distance of seventy feet into the Devil's Coach-house. Along this shaft there are some remarkable stalagmites, shaped like cones, hats, mushrooms, &c. In the cave itself stalactites are in rich profusion. In one part there is a pillar about ten feet in diameter rising from floor to roof, a height of thirty feet, formed by the constant dripping of lime-water uniting stalagmite and stalactite. It would be a fine calculation to estimate its age. Along the sides of the cave are other beautiful pillars, some gnarled and knitted like trunks of trees, others like elaborately carved columns. The water has here formed lovely grottoes and alcoves, terraces, Gothic arches, and cunning carvings. Here and there are narrow chasms, disappearing into darkness as yet unexplored, although one tortuous passage has been followed to the Imperial Cave, to be hereafter mentioned. At the end of the cave the roof rises, and is pierced by an inverted pinnacle, and the walls here are composed of imperfectly developed stalactite formation. In places, liquid substances have fallen and petrified so rapidly as to resemble streaks of lava. The eastern end of the Nettle Cave runs into the Devil's Coach-house at about one hundred and twenty feet above the floor-level of the cavern, and the *coup d'œil* presented is said to be unexampled in cave scenery for weird beauty and strange grandeur. An upper section of the Nettle Cave is called the Ballroom, and is notable for the stalactite formations, resembling vultures, mailed warriors, bearded sages, &c. One of the figures is strikingly like an orator with arm upraised in the act of speaking; and to deepen the effect, there is just beneath him a sort of stone reading-desk fringed with stalactites.

From the Nettle Cave there is a passage into the Arch Cave, about a hundred yards long, noted for its beautiful columns and roof. Some of these pillars, however, have been destroyed by rude visitors before the government took the caverns in charge. When this cave was first opened, the floor was white as snow; but it is now black and greasy by the tread of feet and the drip of candles. Perfect silence and profound darkness still brood in the Arch Cave. Connected with it by a narrow passage is 'the Belfry,' in which are some large stalactites which give out when struck sounds like church bells. One of them in especial has a deep *C natural* tone.

The Elder Cave has to be reached down a sort of shaft or pit, the entrance to which was long hidden by the foliage of the elder-trees. It contains a number of large chambers connected by small passages, and some remarkably fine stalagmites and stalactites. Many of these last hang from the shelving roof to the floor, and form an alabaster palisade. Great bunches of snow-white limestone droop from the roof, and portions of the floor are covered with beautiful coral. It was in the Elder Cave that, ten years ago, the curator

discovered a shaft which led to the discovery of the Imperial Cave. He made three separate attempts to reach the bottom of this black hole, as it appears to be. The first time he was lowered until all the rope was paid out, and left him dangling in mid-air. The second time a longer rope still left him suspended in black darkness. The third time he descended, and was 'paid out' until his feet finally touched bottom, and he found himself in what is now called the Imperial Cave. The experiences of the curator in descending apparently fathomless pits, wriggling through apparently impassable ridges are among the romances of exploration yet to be written. A man must be born for that sort of work, which needs altogether exceptional nerve, coolness, and endurance, as any one who has ever tried penetrating a rock-hole for the first time well knows. The Jenolan Cave-keeper, Mr Jeremiah Wilson, is an Irishman by birth, has been over forty years in the colony, and has had charge of the caves for twenty years.

The Imperial Cave is considered one of the most magnificent of the series now opened. It is described as 'graced with myriads of lovely objects. Darkness brooded over them for ages, as drip by drip and atom by atom they were formed into things that charm and shine in chambers whose walls are clad in beauty of a thousand stars. There are underground gullies terrible enough to be the home of Apollyon with legions of goblins, and strangely elfin palaces where Titania might be supposed to reign and Robin Goodfellow carry on his frolicsome pranks.'

By the entrance of the Imperial Cave is an excavation some seventy feet long and twenty feet wide, which is called the 'Woolshed' because the formation over the walls and roof resembles the fleeces of sheep hanging about and spreading over the shelving rocks. From this a descent is obtained into the 'Architect's Studio,' a cavern which is a marvel of beauty, with large masses of stalactites hanging from the roof and along the walls, column after column profusely decorated with coral and tracery and natural carvings. Most of the formation is white or gray, but some of it is richly coloured.

Then in the Imperial Cave there are a succession of marvellous apartments, called respectively the Margharita Cave, the Helena Cave, the Grotto City, the Lucinda Cave, and Katie's Bower, either after some famous colonial lady, or from some special characteristic. The Imperial Cave, indeed, is full of enchanted grottoes and fairy palaces, which it is practically impossible to describe.

Those which we have just named form the left-hand branch of the Imperial series. In the right-hand branch occur some more gloomy caverns, through which one reaches a subterranean river about ten feet wide which flows at the bottom of a fearful chasm. It is not so big as the underground river in Kentucky, but is even more weird. The water is apparently motionless and very smooth; but it is really moving at considerable speed. Its rocky ledges are ornamented with stalactites, which are mirrored in the water by the light of the magnesium lamp, which is here used with wonderful effect. 'Human imagination could not conceive a freak of Nature more wildly grand or mysteriously beautiful. There are large ornamented pillars near delicately-

tinted formation drooping from overhanging rocks like pensile boughs of weeping-willow. Some of the twigs skim the surface of the stream, and others are bathed in it. Beyond is a water-hole about forty feet long and from sixteen to twenty feet wide. Because of its wonderful clearness, it is difficult to judge of its depth; but it has been tested to the extent of five feet; and probably at the extreme point, where the water flows from the tunnel, it may be six or seven feet. The effect of the brilliant light is superb. The ornamentation on the roof of the tunnel is reflected and transposed in the mirror below, each reflected stalactite having the appearance of a twin stalagmite rising from the river-bed, which may be traversed for about one hundred and fifty yards.'

Near the underground river is the Fossil Bone Cave, the roof of which is some five hundred feet beneath the surface of the mountain. In this cave have been found many fossil bones, which do not seem to have yet been sufficiently examined and described. Other caverns in this portion of the Imperial Cave are named the Sparkling Rock, the Crystal Rock, the Crystal Cities, the Show-room, Nellie's Grotto, &c.

It is impossible to describe all these; but a word must be given to the Shawl Cave. This is about twenty-five feet long by fifteen feet high, and from twelve to fifteen feet wide. It contains three magnificent masses of limestone formation resembling shawls pendent from the roof. One is fourteen feet long, eighteen inches deep, and one-sixth of an inch thick; and the other two are only slightly smaller. They are straw-coloured, varied with rich brown, having in some portions the appearance of tortoiseshell. They hang at right angles from the side of a sloping roof, and the colouring runs in parallel lines. A fine effect is produced when the light is placed behind the shawls.

'Lot's Wife' is another curiosity of the Imperial Cave. It is an alabaster figure standing in solitary grandeur within a gloomy cavern. This figure is wonderfully suggestive, and has not been produced in the ordinary way by drippings from one stalactite, but by two small stalactites combining in working this strange effect.

Almost equal to the Imperial Cave for grandeur and beautiful effects is the Lucas Cave, the entrance to which is very imposing. After advancing into it a short distance, 'the Cathedral' is reached, an immense domed cavern, rising to a height of three hundred feet, which is only one hundred feet short of the height of St Paul's. The limestone walls are terraced with tier upon tier of stalagmites, and in the centre of the floor there is one immense stalagmite. There are many holes which indicate the existence of yet unplumbed recesses, the immense depth of some of which can be partially gathered by dropping pebbles. At one end of this natural Cathedral is the Music Hall, to which access is obtained through a steep passage. It is called the Music Hall because of its fine acoustic properties, the secret of which has not yet been learned, but which would be very valuable to architects.

In another cavern is 'the Piano,' a group of stalactites remarkable for the resonant qualities of their separate parts. Each stalactite gives out a note, which varies in pitch and quality

according to the part on which it is struck. Some of the notes are fine, others imperfect, and the stalactites do not harmonise. Thus, as musical instruments they are not a success, but as stalactites they are astonishing.

But we cannot penetrate farther into this underground of wonders, which spreads, as we have said, for six miles beneath the mountains of the colony of New South Wales. Even Australians, as a rule, do not seem to be aware of these subterranean marvels; but those who desire to know more of them cannot do better than consult the work of Mr Cook, an edition of which has just been issued in this country by Messrs Eyre and Spottiswoode.

A DEAD RECKONING.

CHAPTER XIV.

VARLEY'S COTTAGE, which place George Crofton and his confederates had fixed upon as their rendezvous, was a spot of ill repute for miles around, and one which no inhabitant of the district would willingly go near by day, much less after dark. A grim tragedy centred round the spot. Some quarter of a century previously the cottage had been the home of a certain game-keeper, Varley by name, who had made himself specially obnoxious to the poachers of the district. One night he was shot dead on his own threshold and his cottage fired in two places. The crime was never brought home to any one, neither was the cottage ever rebuilt. But of all this neither Clara Brooke nor Margery, being newcomers in the neighbourhood, knew anything.

The elder woman hurried feverishly onward, the younger leading the way. Scarcely a word passed between them. Presently they reached the stile through which Margery had followed the two men, and crossing it, took a winding footway through the fields. They went swiftly and silently, walking not on the path itself but on the soft grass which bordered it. Not a creature did they see or hear, and before long the path began to dip to a hollow, then came some straggling patches of brushwood, and presently they were in the spinney itself, with trees and a thick undergrowth on both sides of them. Margery led the way as by a sort of instinct, only pausing for a second now and again to listen. To Clara, the adventure, with its darkness, its silence, and its mystery, had all the complexion of a nightmare. Again and again she had to ask herself whether it were indeed a reality.

'We are nearly there now, mum,' said Margery presently in a whisper. 'Do you wait here among the trees, while I creep forward and try and find out what they be about.' So saying, the girl stole forward, and was at once lost to view.

The young wife waited with a heart that bent high and anxiously. The moments seemed terribly long till Margery returned, although in reality she was not more than three or four minutes away. Clara trembled so much that she could not speak.

'There's four of 'em now, mum,' said the girl. 'I could see them quite plain through the crack in the shutter, and ffrom what I could make out, there's more to come. O mistress, I wouldn't go near 'em if I was you; they're a desperate bad

lot, and if they found you there, nobody can tell what might happen.'

Of a truth, Clara might well hesitate, and it was only the thought that some new and unforeseen danger might possibly at that very moment be closing like a net round the husband she loved so devotedly that nerved her to the task she had set herself to do. 'Margery,' she said after a brief silence, 'where you can go with safety I can surely go. I must see and listen to these men for myself.—Now, attend to this. Should I be discovered by them, or should anything happen to me, you will fly as for your life and warn your master.'

'I understands, mum, never fear,' was the girl's earnest response.

Then the two crept together through the trees, almost as silent as the shadows of which they seemed to form a part, and presently Clara found herself under the walls of the ruined cottage. Margery guided her to where a rickety shutter still guarded a small square window, from which, however, the glass had long since disappeared. Through a chink in this, the interior of the room, such as it was, was plainly discernible. Two old-fashioned lanterns threw a dim weird light over the scene. Clara's eyes sought instinctively for the face of Crofton before taking any note of the others; it may be that some faint hope had all along lingered in her breast that Margery had been mistaken. But if that were so, the hope at once died out. George Crofton himself was before her. He was the only one of the party that was seated, and his seat consisted of nothing more than a pile of loose bricks, with part of the stone shelf of the mantel-piece laid across them. He was smoking, as were also two of the others, and seemed deep in thought. The rest of the party were utter strangers to Clara; they talked in low tones among themselves, and, much to her surprise, she saw that one of them was in the garb of a clergyman.

Scarcely had Mrs Brooke noted these things, when a low whistle sounded from somewhere outside. Crofton sprang to his feet, and all were instantly on the alert. The whistle was answered by another from within, and then one of the men left the cottage carrying a lantern. Clara and Margery sank noiselessly back into the undergrowth of bush and bramble by which the cottage on three sides was surrounded.

When, two or three minutes later, Clara ventured to resume her post of observation at the window, she found that the party inside had been augmented by two fresh arrivals. The men had now grouped themselves round Crofton in various attitudes of attention, listening to the instructions he was evidently impressing upon them. Whatever the objects of this strange company might be, there could be little doubt that George Crofton was the leader of it. One man, who bent forward a little, had made an ear-trumpet of his hand, and it might be for his benefit that Crofton now pitched his voice in a higher key than he had previously done. Clara hardly breathed as she strained her senses to catch the words that fell from his lips.

What she heard, gradually piecing the plot together in her own mind as Crofton issued his final orders to the men, was enough to blanch the heart of any woman with terror and dismay.

The train to Cumberhays was to be attacked and robbed; some great treasure—Clara could not make out of what nature—was to travel by it to-night, which these desperadoes had determined on making their own. As a preliminary step, the signalman at Cinder Pit Junction was to be seized, bound, and gagged, his box taken possession of, and the telegraph wires cut. A member of the gang who answered to the name of Slinkey, and who understood the manipulation of points and signals, would install himself in the box. Then, when the train came up on its way to Cumberhays, passing the box at a speed of about twenty miles an hour, by a reversal of the points it was to be turned by Slinkey on to the branch leading to the collieries. As a matter of course, the driver would bring his train to a stand as speedily as possible, and then would come the opportunity of the gang. It was well known that, except at holiday times, passengers and officials together by this train rarely numbered half a score people. It would be strange if half-a-dozen desperate men, armed with revolvers, could not so far intimidate the driver, the guard, and a few sleepy passengers as to have the whole train at their mercy. Five minutes would suffice to successfully achieve the object they had in view, after which the train might go on its way again as if nothing had happened.

Such were the chief features of this audacious scheme, as gathered by Clara from Crofton's instructions to the others. Of course, each man had known beforehand what he was expected to do, and what passed at the cottage was merely a sort of final rehearsal of the scene that was to follow.

Crofton now looked at his watch and announced that it was time to start. The lanterns were extinguished, and the men filed silently out of the cottage, half of them taking one road and half another. Clara and Margery had but just time to draw their shawls over their heads and crouch on their knees amid the brushwood, when three of the men passed within as many yards of them. When all was silent again, they stood up. Never on any previous occasion when danger threatened her husband had Clara felt so utterly helpless as she did now. What could she, one weak woman, do to confound the machinations of six armed and desperate men?

'O Margery,' she cried, seizing both the girl's hands in the extremity of her distress, 'there seems no help either in heaven or on earth. We are lost—lost!'

The faithful girl could only kiss with a sob the hands that held her own. 'What be they going to do, mistress?' she asked a moment or two later. She had not been able to see and hear what had passed in the cottage, as Clara had done.

'They are going to seize and bind your master, and then they are going to stop and rob the train. O Margery, if there was but some way by which the train could be warned in time! Think, think; is there nothing we can do?'

'Why, o' course there is, mum,' answered the girl with one of her uncanny chuckles. 'You just let me run home as fast as my legs'll carry me and get three or four singles—them things, you know, that Muster Geril used to fasten on the rails when the fog was bad in winter. I

know how to fasten them, 'cos I watched Muster Geril do it one day when I took him some to the box. Then I'll take the short cut across the fields to where the line turns sharp round more'n half a mile away from the box, and I'll fix the singles there.—But what am I to tell the driver, mum, when he stops the train?'

'Tell him there are half-a-dozen men with revolvers who are going to stop and rob the train, just beyond your master's box. After that, he will know what it will be best to do.' She could have flung her arms round Margery's neck and kissed her, such a weight had the girl's words lifted off her heart.

'But what about pore Muster Geril, mum?' urged Margery.

Ah, what indeed! Clara shivered as though an icy wind had struck her. She had not failed to notice that her husband had never been mentioned by name by Crofton, who had spoken of him to the others as though he were an utter stranger. Could it be possible he was unaware that Gerald filled the position of signalman at Cinder Pit Junction? It was possible, but by no means probable; but in that faint chance lay her only hope of her husband's safety. In that case, should he and Crofton not encounter each other, the rest of the gang would merely regard Gerald in the light of an ordinary railway servant; and although he might chance to be assailed and maltreated by them, that would be but a minor evil in comparison with the other, and one which an hour or two at the most would set right. These thoughts passed through her mind far more rapidly than she could have given them utterance in words. The only question now was, had she time to warn her husband before the attack took place? The gang were on their way already: could she overtake them, pass them unseen, and reach the signal-box before they did? The chance was a desperate one, but she must attempt it—no other course was open to her.

'Come!' she said, grasping Margery by the hand. 'Let us hurry—let us hasten! While you go and fix the signals, I will go and warn your master, only pray heaven I may not be too late!'

With scarcely a word more they sped swiftly back along the starlit fields; but when they reached the stile, Clara said: 'Is there no nearer way to the signal-box than going round to it by the high-road?'

'There's a way through the fields, that cuts off a big corner. I've walked it onst; but I dunno, mum, as you could find it in the dark.'

'I must try,' answered Clara desperately. Every second was precious.

The near cut in question was through a second stile somewhat farther on. At this point, after a few last words, the two parted, each going a separate way.

Clara's way led her through more fields; but the track was so faint that she was utterly unable to distinguish it, and had to trust to her vague local knowledge that she was going in the right direction. In a little while she surmounted a rising ground, and then, to her utter dismay, she saw, from the position of the signal lamps in the valley below, that she had wandered a full quarter of a mile too far to the right of them. It was a thousand chances to one now that Crofton and his crew would be there before her.

Anguish lent wings to her feet, and she flew down the slope like a creature pursued by the Furies. She could see the lighted window of the signal-box shining in the distance, a faint yellow disc. The next thing she knew was that she had reached the boundary of the line, but at a point still some distance from the box. It now became needful to exercise more caution than she had hitherto done, lest she should be seen by any of the gang, who were doubtless somewhere near at hand. The line at this point was bounded by a wooden fencing put up to prevent the straying of cattle, close to which, on the field-side, grew a thin straggling hedge. Under the shelter of this hedge Clara now stole softly and cautiously forward, with eyes and ears preternaturally on the alert. Step by step she drew nearer without being disturbed by a sight or a sound, till at length she faced the box with its lighted window where it stood on the opposite side of the line. Then with a heart, the pulsing of which sounded like a low drumming in her ears, she parted the bushes and peered through.

For a moment or two a mist dimmed her eyes, and all she could discern was that there was some one inside the box. Then the mist cleared away, and she saw that the man standing there with one hand resting on a lever was not her husband, but the man Slinkey, whose sinister face she had seen through the broken shutter. Gerald was nowhere to be seen. She had come too late!

WOOD-CHARCOAL.

WE all know that if a piece of wood be placed in the fire, there will very shortly be nothing left of it but a little incombustible gray ash: its other component parts, carbon, hydrogen, and oxygen, have combined with the additional oxygen of the air to form carbonic acid and water, which have been dissipated into space. If, however, instead of allowing the air free access, we to a certain extent confine the burning wood, no true combination can take place, and we shall find it impossible to reduce it to ash: it will instead be converted into a mass of charcoal, or *carbo liqui*, of similar form to itself, its elements having undergone what chemists call 'destructive distillation,' which means that, under the action of heat out of contact with air, they have arranged themselves into different forms of combination. This change can readily be observed by heating to redness a piece of wood in a glass tube closed at one end, and will serve as an illustration of the method of preparing charcoal for fuel, by burning the wood in heaps closely covered with turf and sand or mould, with only a few openings for the entrance of air sufficient to carry on the imperfect combustion required, and leaving it to smoulder for three or four weeks. Notwithstanding the intense heat employed, no part of the wood appears to have been consumed when the pile is 'drawn,' as it is termed; not only the bark but even the moss upon it comes out as entire as it went in, the only change apparent being its deep velvet black colour, and its having been rendered friable; in short, the wood seems only to have been very highly dried. True, it has shrunk a little, but there is no visible

derangement of parts; its brittleness alone proves that its nature has been altered. The quantity of charcoal derivable from a given quantity of wood is affected by its age and dryness; on an average, one hundred parts of wood will yield twenty-two of charcoal; but this amount will be considerably reduced if great care be not exercised when 'drawing' that none of the pieces ignite on being exposed to the air, for every particle burnt is so much waste; every piece still retaining fire must be at once quenched with water. The heat attending the drawing of a charcoal pile is intense; an ancient authority thus wrote of it: 'The drawing is an infernal business, the men working among fire and heat enough to suffocate Satan himself.'

The useful properties of charcoal—or, as it is scientifically termed, *amorphous carbon*, from its non-crystalline nature—depend for the most part upon its very great porosity, occasioned by the expulsion of the bodies volatilised during combustion, which endues it with the power of absorbing great quantities of gas. The microscope shows the pores to be disposed in order, and to traverse it lengthwise; and there is no piece of charcoal however long but it may be easily blown through; and if a piece be broken pretty short, it can be seen through with the microscope. It has been reckoned that in a piece of one inch diameter there are no fewer than 5,724,000 pores. Its porosity may be strikingly exhibited by attaching a weight to a stick of charcoal so as to sink it in a vessel of water, placed under the receiver of an air-pump, on exhausting the air from which, a brisk effervescence will ensue, caused by the innumerable bubbles of air escaping from its pores. A cubic inch of it will absorb one hundred cubic inches of ammonia gas, or fifty of sulphuretted hydrogen, the two most conspicuous among the offensive results of putrefaction; the knowledge of which fact has led to its employment to sweeten meat, fish, game, and other food that is beginning to go bad, as well as to deodorise, that is, to rob of their offensive smell all kinds of putrefying substances. The harder the wood from which it has been prepared, the greater this power: logwood charcoal, for instance, can absorb one hundred and eleven times its own volume of ammoniacal gas; while that made from the shell of the cocoa-nut is even more absorbent, though its pores are quite invisible. To give an example of the process. A piece of charcoal whose pores are full of oxygen imbibed from the atmosphere, is exposed to the action of air containing sulphuretted hydrogen, a gas capable of undergoing oxidation: within its pores the sulphur will combine with the oxygen to form sulphuric acid (SO_3), and the hydrogen to form water (H_2O).

Since all gases given off by decaying matter are poisonous, this property of charcoal is of paramount importance. The best form to apply it is in that of a coarse powder, and to strew it thickly over the rotting mass. In this form, before the days of improved antiseptics, such as chlorine gas, Condy's Fluid, Sanitas, and many others, it used to be exposed in hollow trays in our hospital wards and dissecting-rooms, to sweeten the air. It was, of course, not nearly so effectual, as it can act only on air in immediate contact with it. It has also been inserted as a ventilator

in windows, contained between two sheets of fine wire-gauze, to afford protection against contaminated air, on the same principle as in a respirator. The ventilators of our street sewers are fitted with cases of it for a like purpose. Water is filtered through it, not only to remove mechanically suspended matters, but also to free it of the sulphuretted hydrogen sometimes developed. The insides of casks are often charred, so as to reduce the lining to a kind of charcoal that shall keep the liquor sweet and good; and in toast-and-water we see yet another example; the surface of the bread having been converted into charcoal, purifies the water, rendering it palatable, and at the same time preventing its contamination by the impurities of a sick-room. For all such cases as those mentioned, the charcoal should be heated to redness in a covered vessel prior to being used, in order to drive off the moisture it has attracted from exposure to the air.

This power of absorption is not, however, confined to gases. Many liquid and solid substances that have been dissolved in water can be removed by it. If we shake up a coloured substance, say port wine, with powdered charcoal, and then filter the mixture, the wine will be found to have lost its colour; the resulting liquid will be as limpid as water: the colouring matter has adhered to the grains of charcoal, from which it can be extracted by treatment with a weak alkaline liquid. The filthiest and most putrid ditch-water can in like manner be rendered perfectly clear, inodorous, and insipid. The decolourising power of wood-charcoal is, however, very feeble in comparison with that possessed by animal charcoal, obtained by calcining bones, with which the sugar-refiner takes the colour out of his syrup, and the distiller deprives the rancid oils which contaminate his spirit of both their smell and taste.

We need not dwell on the value of charcoal as an ingredient of gunpowder, and will pass on to some of its other uses. When burnt, it produces just double the heat of an equal weight of wood, due to its being nearly pure carbon, and to the fact that much of the heat evolved in the combustion of wood is rendered latent in the steam and other vapours produced by the action of heat. It possesses, however, the serious drawback of emitting those suffocating fumes of which we are too often reminded by the sad deaths resulting from burning it in a brazier in an unventilated apartment. If steam be passed over red-hot charcoal, carbonic oxide, a highly inflammable gas, resembling in many respects the carburetted hydrogen we burn in our houses, is produced: it is of so poisonous a nature that one volume of it diffused through one hundred volumes of air renders the latter totally unfit to sustain life; and only a few years back, quite a panic was caused in Paris by the proposal to employ such a poisonous agent for illuminating that city.

Mathematical instrument makers and engravers find charcoal of great service in polishing their brass and copper plates. The artist employs it for sketching in the preliminary outlines of his great picture. Combined with iron it produces steel. It supplies the most durable and useful black of the painter and varnish-maker. The Anglo-Indian is dependent on it for the cooking of his food. Being the most perfect solid non-conductor of heat known, it is largely applied

to the packing of refrigerators and for covering boilers to prevent the radiation of heat. It is an excellent conductor of electricity. The medical man employs it in various ways both internally and externally, chiefly that made from a light porous wood, such as the young shoots of the willow and poplar: from its antiseptic and vital properties it is useful in many forms of fever; it is of service in dyspepsia, dysentery, &c.; taken in the form of a biscuit, lozenge, capsule, pill, or powder, it is good for indigestion and flatulency; mixed with bread or linseed it is a favourite poultice for ulcers. It furnishes an excellent dentifrice, being sufficiently hard to remove the concretions from the teeth without injuring the enamel; while it neutralises for the time any fetor arising from a carious tooth; and from its before-mentioned property of carrying down from solutions many colouring matters, it has been recommended for cases of poisoning by corrosive sublimate, arsenic, morphia, strychnine, &c.

One of its most remarkable features, which it possesses in common with other varieties of carbon, is its unchangeable solidity, being insensible to both fusion and evaporation, nor has any substance yet been found capable of reducing it to the liquid state. It was anciently used to distinguish the boundaries of estates, as being supposed incorruptible when let deep into the ground, and many pieces have been found entire in the tombs of the Northern nations. Charcoal made of corn has been discovered, probably as old as the days of Cæsar, so well preserved that the wheat may still be distinguished from the rye.

One little historical incident connected with this all-serviceable material, and we have done. In the early part of this century charcoal gave its name to a certain secret political association that flourished in Italy during the French régime in Naples. Its members sought refuge in the mountainous regions of the Abruzzi, where they took the name Carbonari (charcoal-burners), from the ordinary vocation of the inhabitants. Napoleon III. when a youth was a member of this society, which has been assigned as one of the causes that led to the Franco-Sardinian war against Austria.

A LEGAL SECRET.

CHAP. IV.—THE OLD HOME.

ONE sunny afternoon, some days after the meeting between Rosa and Mr Pilkington in the octagonal room, the two were seated side by side in the lawyer's carriage, and driving rapidly across the broad heath which led towards the gates of the senior partner's villa. Never had Rosa, pretty as she was, looked so pretty as she did to-day. She was leaning out at the open window in dreamy wonder. The expanse of blue sky over the great common was interspersed with fleecy clouds: their soft shadows floated over the heath, giving a changeful expression to the scene. Birds fled by with a flash from their swift wings; and frequently a lark would flutter upwards, and with its sprightly song bring tears of delight to the young girl's uplifted eyes. She longed to spring from the carriage, and run among the bushes of yellow gorse, and chase the white butterflies and gather wild-flowers, as she had often done in

childhood ; for she felt as though she were again a child.

'Ah! there is my old home!' Rosa exclaimed, as she suddenly caught sight of the solemn sphinxes. 'Are not those the gates?'—

'My dear'—and Mr Pilkington's voice seemed to remind her that she was no longer so very young—'you have not forgotten, I hope, what I told you?'

Rosa bent her head and pouted her pretty lips. 'I am to ask no questions?' said she in a slight tone of rebellion.

'Precisely. We are to ask no questions;' and the old lawyer patted the young girl's hand approvingly. 'There must be no manifestations of surprise. It is time that we began at our age to suppress our feelings. Are we not agreed on that point?'

Rosa gave him several rapid nods.

'We are apt to be impulsive, my dear, and consequently we must keep a guard upon ourselves. In good society—that is to say, among well-bred people—there never should be any undue display of sentiment. The impulse must be checked; for the great aim among cultivated classes is to hide every sign of emotion.'

The girl sank back in her seat. She could not utter a word; for there was a great lump in her throat that almost choked her. The situation was overpowering; with every turn of the carriage-wheels she realised more distinctly that her dream—the dream of her early girlhood—was coming true. Hide every sign of emotion? She felt crushed and broken in spirit, as if a heavy weight had been laid on her heart. This beautiful heath had been her playground; and beyond—where the great gates stood invitingly open—the rest of her dream lay, as it were, buried behind the green and massive foliage of shrubs and gigantic trees. The twelve years that had intervened, with all the wretched poverty and discontent that had arisen out of it—even Abel Norris, for whom she had so genuine an affection—had for the moment gone out of her life. Suddenly, she looked up. They were driving in at the gateway. Through her tears she caught a glimpse of the grave sphinxes; and they seemed to be silently reiterating Mr Pilkington's words: 'It is time we began to suppress our feelings. Are we not agreed on that point?'

As they drove up the avenue, with its patches of sunlight shimmering through openings among the leaves—an avenue that seemed almost endless—Mr Pilkington continued: 'It is difficult'—and Rosa thought she recognised a touch of emotion in his voice—'I am ready to concede that—very difficult to suppress one's feelings—sometimes almost impossible. But you are a sensible girl. Had I not been convinced of that, my dear, should I not have acted differently?—You will not object,' Mr Pilkington added with a slight smile, 'to remain in your own rooms until to-morrow? Remember! I do not insist; but I think—taking everything into consideration—that it would be advisable. Are we agreed on that point also?'

'It is what I would have asked: I long to be alone,' said Rosa. 'All that has happened—all that I now see around me—brings back to my memory that dear face'—

'Rosa! At our age? Remember!'

The girl was silent; but she clasped her hands tightly together and bit her lips to suppress a flood of tears.

'You will be pleased, I think, with your rooms,' said the lawyer cheerfully after a moment's pause. 'They look out upon a choice bit of scenery; and should you be disposed to take a stroll in the grounds, my dear, pray do not hesitate. My suggestion merely referred to the house. I would not wander about the house; we have a good many guests this evening. That is all I meant. And at dinner-time—as we have this company—you shall be served in your own little sitting-room. Company is fatiguing—until one has learnt to suppress one's feelings. Ah, well! all in good time.'

The carriage now drew up at the entrance to the villa. A flight of broad steps led to the front door, with vases full of growing flowers, and marble pillars on each side, like a temple. A large conservatory stood on one side, and the doors being wide open, Rosa caught a glimpse of the most beautiful exotic plants. A cry of delight rose to her lips. But a glance from Mr Pilkington, who seemed to be repeating, 'My dear! At our age? Remember!' quickly recalled her.

But Rosa at last found herself alone in her own rooms, with no Mr Pilkington to restrain her expressions of joy or sadness. They were prettier rooms than she had ever seen: a sitting-room with a bedroom adjoining. And her rapture increased when she found them tastefully decorated with flowers—doubtless gathered from that wonderful conservatory. Both rooms looked upon the park; and the girl stood for some minutes gazing out, lost in dreamy admiration at the scene. The windows gave upon a terrace with steps leading down into a garden, where all the brilliant colours of the rainbow seemed to be repeated in flower-beds of every size and shape. There was a paddock beyond, enclosed with iron railings; and beyond this paddock there were wooded valleys and hills that appeared all the more reposeful from the rapid change of sunlight and shadow that passed over them.

Rosa unclasped the window and stepped out upon the terrace. The summer breeze touched her cheeks; the colour crept into them like a blush; and her lips, half parted, drank in the balmy air. There was a wildness in the flash of her dark eyes. Was not this her old home? She flung her hair back from her forehead, as she had often done in her dismal home in Took's Court when giving way to her natural emotion; and she stood glancing about her like a captive fawn that has not yet had time to realise that it has gained its freedom.

But presently she fled down the steps and across the flower-garden, and entered a pathway beside the paddock leading into a wood. On she ran into the deep shade. Snatches of half-remembered songs escaped her and found an echo overhead in the songs of birds. The lawyer's admonition was forgotten. Her one thought was to review the scenes of her early days; to refresh the fading recollection of this old home, which she no longer thought of as in a dream. She came at last upon a bench at the end of a long pathway. It was a very rustic seat; but a shadier spot could scarcely have been found. On the

back of this bench, cut in the woodwork, Rosa discovered these initials: R. G.—S. T.; and underneath was inscribed the date. The carving had been executed thirteen years ago; and she remembered the boy who had done it. Had not this place been the favourite haunt of Rosamond Gage and Sidney Trench in bygone days? There was no need of this rough record to remind her of that. Few moments in her young life were more crowded with pleasant memories than those which had been passed in this silvan spot. In a book of goblin tales which Abel Norris had given her, it had been here that she had pictured the moonlight gambolings of airy sprites. And while she now sat drowsily pondering these things, with her eyes closed in a light sleep, the wood became once more a scene in fairyland. Laughing imps looked at her in crowds from behind the trunks of trees and among the leaves and branches overhead; and some of them, growing bolder, danced into the pathway, and poised themselves upon the bench behind her, and peeped over her shoulder, as if playfully welcoming her to this goblin home.

But where was the Prince, her devoted lover, who lived in this fairy wood? She listened. Was not that his footstep? Rosa started and opened her eyes. Had she been dreaming? The goblins had vanished; but the footstep was still in her ear. She glanced towards a patch of blue sky in the opening at the end of the path. It was like a mirror framed in green leaves and arching branches; for presently a figure was standing reflected there; and Rosa at once recognised the figure as Sidney's. She ran to meet him as she would have done in childhood; no sense of restraint entered into her thoughts. It had been different when they met in New Square; for it was all visionary then—a dream that she believed could never come true. Was not all this reality?

'Ah, Rosa! I thought I should find you here.'

Rosa made no immediate reply. She walked at his side through the shady pathways, as if scarcely yet fully awakened. Her head was bent; but she knew that he was glancing down at her with deeper curiosity than when they had met in Lincoln's Inn. And the tone of his voice seemed changed: he was more like the old Sidney that she had known in bygone days, when they ran here together with the light and thoughtless step of childhood. She looked up at last.

'Do cultivated people,' said she—'people who are taught to suppress their real sentiments—ever come here?'

Sidney laughed. 'The very place,' he answered 'that they would be the most likely to choose. I come here—frequently.'

'Not to dream, do you?'

'To indulge the wildest dreams!' was the reply.

Rosa's face became thoughtful. Did he ever dream of her? Did he ever recall, as she recalled them now, their sunny hours here together? How she longed to take his hand, as she had often done, and speak of those moments which could no more have escaped his memory than hers.

'Did you think me such a prosy lawyer?' he continued. 'Did you think that I never had one romance—an uncompleted one—in my life?'

'Yes,' she replied with candour; 'I thought you very matter-of-fact.'

Sidney hastened to ask: 'Why so?'

'Only because,' she answered unhesitatingly, 'Mr Pilkington is—or was—your guardian. He must have taught you, for years past, never to give way to sentiment, to suppress all emotion. He has not, or professes not to have, any feeling at all. At least,' added the girl, 'so I judge from what I have seen of him so far.'

'Perhaps,' said Sidney, 'Mr Pilkington has acted towards you so far as a man of business. We are very matter-of-fact in Lincoln's Inn during office hours.'

'But he was the same,' said the girl, 'when crossing the heath. He has such a horror of tears.'

'There may be a motive. Are you not our client?'

Rosa suppressed a sigh. 'Ah, yes; I had forgotten.'

They now reached the edge of the wood. She caught sight of her windows across the lawn. 'Good-night,' said Rosa, holding out her hand; 'I shall not see you again to-day.'

Sidney glanced inquiringly into her face.

'There is company this evening,' said Rosa; 'so Mr Pilkington tells me: I have agreed not to appear. He is right, I suppose,' she added peevishly. 'One must learn to hide one's feelings.—Is it very difficult—I mean in society?'

'No. The difficulty is—— But I'll tell you another time. Good-night.'

Sidney stood watching the girl as she ran across the lawn. She waved her hand to him from the terrace, and then went in quickly, as if conscious of having done wrong. Would she ever subdue her impulse?

Since their tacit recognition of each other in Took's Court, on the first day of Sidney's visit, he had thought constantly of Rosa. Had not the little sweetheart of his boyhood grown up into a lovable woman, with all the old petulance and amiability that had characterised her as a child? He had found it no easy matter to remain silent on the subject of those early days, even when they met in Lincoln's Inn. How far greater the difficulty to-day, when they had met in the old wood, which had brought back to both of them a vivid recollection of the early affection for each other? Perhaps Mr Pilkington's influence had something to do with the young lawyer's reticence as well as with Rosa's. Mr Pilkington had been clothed a good deal of late with his junior partner; and Sidney had begun to show signs of greater earnestness and discretion. Could the time be far distant now when all the weight of responsibility, which Mr Pilkington had been so silently accumulating, would fall upon his (Sidney's) shoulders? It was quite evident that some degree of caution—possibly bearing upon some legal secret—had been imposed upon him.

The dinner-party to-night at Mr Pilkington's villa, given to distinguished clients, is quite superb in its way; though the noiseless manner in which the servants move backwards and forwards behind the chairs, and the mysterious style in which the butler removes the covers—as if there might be legal secrets under them—may express more than is intended. Not that any one exhibits the slightest sign that an anxious thought

has a place in his mind. Every face is animated, Mrs Pilkington's most of all. Even Mr Pilkington indulges in pleasantries in his subdued way. He never awakens any recollection—never by look or word—of the oblong room with barred windows: his conversation is never suggestive of an octagonal room adjoining, where every one present has waited his turn more than once. There never was a better-bred set of people—people who had accomplished the art of concealing emotion to the complete satisfaction of Mr Pilkington, and society at large.

It is only when all the guests are gone and the old lawyer has retired to the library, that Sidney notices a change in Mrs Pilkington. He is watching her, unobserved, from the conservatory. His face has an altered look too. Presently—not without an expression of purpose in the action—he steps into the drawing-room. The glance with which Mrs Pilkington greets him is full of affection; for Sidney has been like a son to her ever since she became Mr Pilkington's wife. 'Sidney,' she says, 'indicating a place beside her, 'I have been wishing to speak to you the whole evening.'

He sits down and takes the hand that she holds out tenderly towards him. 'I have read the wish in your face,' he replies. 'Is it not about Mr Pilkington?'

'Yes; for my dear husband tells me,' says she, 'that you are going to take his place; that he has decided to retire. It is a grave responsibility.'

'More so,' Sidney answers, 'than I imagined. There are many secrets.'

'Do they trouble you?'

'One of them does; it requires such delicate handling.'

'Mr Pilkington will advise you.'

'He cannot, in this case. Among other secrets, distressful enough in their way, he has told me his own—the one that he hid from you.'

Mrs Pilkington glances at Sidney with surprise. 'Has he told you that?' Her voice is scarcely audible. 'Is it that which troubles you?'

Sidney's look confirms it.

There is a moment's pause. 'It is the one, then—the secret contained in some correspondence—in a packet of letters?'

'Yes; that is the one,' is Sidney's reply.

'Those letters are destroyed,' she answers hurriedly. 'I burnt them, Sidney, in my dear husband's presence. Did he not tell you that?'

'Yes; and your goodness of heart—your boundless confidence in him—was almost more than he could bear! If you had only suspected of whom those letters spoke—what secret they contained—you would never have thrown them into the fire.'

Mrs Pilkington clasps her hands tightly together and looks up eagerly. 'What are you telling me?' says she in a piteous voice.

Sidney answers thoughtfully: 'We have sometimes spoken together—though on rare occasions—of her whose memory is very dear to you and to me. We have both grieved over the loss.—Can you bear to speak of her now?'

Mrs Pilkington bows her head. The tears are rolling down her cheeks; she cannot answer him in words.

'All hope,' Sidney continues, 'of ever seeing

her again—though our love for her has never lessened—died out of both our hearts years ago. We have mourned for her as one who is dead.'

Still the tears fall fast. What better confirmation that she acquiesces in all that Sidney is saying?

'More than once,' the young lawyer resumes, 'it has been suggested by Mr Pilkington that—although it would be impossible to replace her—by hunting the world over, it still might be advisable for you to have some companion'—

'Not to replace her, Sidney; that can never be.'

'Still, dear Mrs Pilkington, you have at last consented. A young girl—one that no one could help loving—has been found.'

'It was to please him'—

'But—will you not see her?'

Mrs Pilkington looks up quickly. 'To-night? Is it my husband's wish?'

'It is mine.'

Something in Sidney's voice brings a keener glance into her eyes; she searches his face more closely; she speaks in a soft tremulous voice: 'She is some one you love. Is she not, dear?'

'Yes,' and Sidney rises slowly from his chair. 'I loved her when a child.'

Mrs Pilkington utters a suppressed cry.

'I love her more deeply now. She was—and still is—my little sweetheart.'

Starting up with an eager look in her eyes, Mrs Pilkington steps towards the door. Sidney, in sudden alarm, overtakes her; and but for his supporting arm she must have fallen.

It is past midnight now. Rosa is lying with wakeful eyes watching the tremulous circle of light thrown upon her bedroom ceiling by the dim night-lamp on her table. Her thoughts are busy still with all that has happened since the morning. She almost dreads to close her lids, lest she should fall asleep, and presently wake again to find herself in her little garret in Took's Court, as she had many a time done after dreaming happily of her old home.

The parting with Sidney Trench to-day at the edge of the grove has awakened a feeling of sadness. Nor does the thought that they must soon meet again—probably on the morrow—remove this sense of unhappiness. She cannot complain of his attitude towards her; it is everything that she could have wished. Any reference to their childhood would have displeased her: this tacit understanding between them—the drifting back slowly into the past—is all she craves. Can their meeting in the old wood again, now that they have both reached a more romantic age, have unconsciously roused a deeper love in her heart?

Rosa knows that all the guests must be gone; for there is a stillness in the house that assures her that even the servants have retired. But still she feels no inclination for sleep: her brain is feverishly active. There is one face—one that is the most distinct in the memories of this home—which she has not yet seen: the face that had bent over her in bygone days.

While Rosa is still meditating, with her eyelids sinking slowly at last, her door is softly opened, and an eager figure is coming towards her with keen look and outstretched arms. A face bends over her and whispers to her in the softest voice: 'My little Rosa—my child!'

Rosa quickly opens her eyes. The face that she looks up into is intensely beautiful; for there is expressed in every feature wonder and adoration. It is the face she has seen a hundred times in her dreams.

M A R G I N A L I A.

THE practice of annotating one's books with marginal notes is, within certain limits, an excellent one. Striking passages often suggest thoughts which, if not immediately jotted down, are lost for ever; and many literary workers who draw inspiration from the past have reason to be grateful for marginal notes in books which have finally found a resting-place in our great public libraries. Some of these notes are indeed of infinitely greater value than the works in which they are written. It has, from time to time, been proposed to publish in an accessible form some of the more important of these anonymous notes; but so far, except one or two contributions to periodical literature, the suggestion has not been carried into effect.

Several authors have, however, given to the world their marginal notes, and in not a few cases their best ideas are to be found in them. Those of Hartley Coleridge, for example, extending over most of the British poets, are more valuable than his set Essays. Mr Theodore Watts, too, has a copy of the Life of Haydon, containing, in the form of marginalia by Dante Rossetti, the best criticisms ever made on Haydon's life and genius. Poets, indeed, have ever been great annotators. Writing to a correspondent, Burns declared that he would not give a farthing for a book unless he were at liberty to blot it with his criticisms. Coleridge read little without making marginal notes, each of which was signed by his initials, 'S. T. C.' and like Carlyle, he willingly performed this service for his friends. In one of the best of his Essays, Charles Lamb has embalmed this characteristic of the philosopher in his own inimitable way. 'Reader,' he says, 'if haply thou art blessed with a moderate collection, be shy of showing it; or if thy heart overfloweth to lend them, lend thy books; but let it be to such a one as S. T. C. He will return them (generally anticipating the time appointed) with usury, enriched with quotations, tripling their value. I have had experience. Many are these precious manuscripts of his (in matter oftentimes, and almost in quantity not infrequently, vying with the originals), in no very clerly hand—legible in my Daniel, in old Burton, in Sir Thomas Browne; and those abstruse cogitations of the Greville, now, alas! wandering in Pagan lands. I counsel thee, shut not thy heart, nor thy library, against S. T. C.' Many of Coleridge's annotations are published in his *Literary Remains*.

Leigh Hunt covered all his books with delicate markings, liberally underscoring passages of which he approved, even if they extended down the whole of the page, and jotting in the margin such remarks as, 'This is Chaucer-like,' &c. To this habit we are doubtless indebted for those excellent handbooks to English literature, his *Wit and Humour* and *Imagination and Fancy*. Shelley, Campbell, John Mitford, and Poe were likewise prolific annotators. The author of the *Raven* liked his books with wide margins, so that he

could jot down any ideas suggested by the text; and when they were not wide enough for all he wished to write, he committed his thoughts to a slip of paper, and fastened it between the leaves with gum.

Among miscellaneous literary men, it is much easier to enumerate those who were not, than those who were, fond of copious marginal notes. A few of the great annotators—such as Burnet, Porson, and Carlyle—must, however, be mentioned; nor can Macaulay and Thackeray be passed over. The great historian, although he disclaimed the critical faculty, made voluminous notes on everything he read, from the Fathers to the trashiest novel. Trevelyan tells us that to one of his favourite works of fiction he compiled a table showing the number of catastrophes throughout the volumes; and as an instance of his scrupulous attention to the minutie of the press, it is recorded that he prided himself on a slight correction of his in the first page of *Persuasion*, by which he turned into sense a passage which had puzzled, or which ought to have puzzled, two generations of Miss Austen's readers. Some of Macaulay's suggestions and notes, of a much more pretentious character than the two examples we have given, were undoubtedly of permanent value; but at his death his library was scattered, and consequently what might have benefited mankind has fallen into the hands of only a few persons. Thackeray's marginalia were of a novel and singularly interesting nature, being indeed pencil or pen-and-ink sketches, all faithful conceptions suggested by the text. In one of his text-books, Thucydides, used by him when at the Charterhouse—the 'Grey Friars' of his novels—there are scribbled some boyish verses. Throughout nearly all the other works sold at his death there are scattered droll marginal pencillings, after the style of those charming little vignettes in his novels. Some of them, as in the *Punch* drawings, show the familiar broken nose, while in the right-hand corner of one or two of the larger and more ambitious efforts the inseparable spectacles are so arranged as to form a 'W'—his first initial.

The custom of annotating books, though not of great antiquity, is thus sanctioned by many great names in literature; but as a rule, the true book-collector, the gentleman who does not buy his books solely for the utility and pleasure he can derive from them, is very much opposed to anything of the sort. Of Chancellor Kent, known in this country as the author of Kent's *Commentary*, a writer says that to a lawyer the Chancellor's written remarks on his books are perhaps their most interesting feature. Having quoted this statement, John Hill Burton, in the *Bookhunter*, adds: 'The practice attributed to the Chancellor of annotating his books is looked upon by collectors as in the general case a crime that should be denied benefit of clergy. What is often said, however, of other crimes may be said of this, that if the perpetrator be sufficiently illustrious, it becomes a virtue. If Milton, for example, had thought fit to leave his autograph annotations on the first folio Shakespeare, the offence would not only have been pardoned, but appreciated, greatly to the pecuniary benefit of any one so fortunate as to discover the treasure.' The genial writer then narrates an anecdote of a collector who lent a set of rare tracts connected with the

religious disputes in Queen Elizabeth's reign to a gentleman who deemed himself a distinguished poet, and he 'thought proper to write on the margin the sensation caused within him by the perusal of some of the more striking passages, certifying the genuineness of his autograph by his signature at full length in a bold distinct hand!'

This offence is really unpardonable, though by no means rare, and the sympathies of all librarians will be with the collector. Since Cobbett made the columns of the *Times* his happy hunting-ground for grammatical errors, his example has been followed by many people possessing not a title of his qualifications. From newspapers such people have gone to literature, until now it is quite common to see a valuable book defaced by pencil corrections of what the scribe conceives to be false grammar, with an indignant dash of the pen through them from the hand of a subsequent and better-informed reader. This form of marginalia is quite bad enough; but what can be said of the 'profound and critical annotations' that are too often seen in nearly every volume of imaginative literature in a library?

After all, it is not easy to write good annotations of a critical kind. Difference in taste is never more strikingly exemplified than in literature; hence, unless to correct a date or a serious typographical error, readers should not write upon books which do not belong to themselves. To write upon the books of a public library or those borrowed from friends, one's own opinions as to the merit or otherwise of any particular passage, is little short of an impertinence. There is nothing more painful and annoying to a reader of intelligence than the marginalia of ignorant or half-educated critics, whose notes but too plainly exhibit their unfitness to express an opinion on the subject-matter of the book. In the case of the reader's own books, he may of course do as he pleases, with this caution: that if he is young—say in his student days—when he jots down his annotations on his books, and comes upon these same jottings twenty years afterwards, he may receive a slight shock. 'What an idiotic prig people must have thought me, if I talked the same rubbish I have written down here,' will probably be his comment upon himself. He would have been wiser to have jotted down his early thoughts on the leaves of his note-book, which leaves, in his maturer years, he might, if he chose, tear out and destroy.

THE PILOT'S CLOCK.

I.

'Mind, Dolly, you must be home by six—not one minute later.'

'Wouldn't a quarter past six do, aunt?'

'Well, Dolly, I do believe if you were to get Ireland for an estate, you'd be asking for the Isle of Man, just to make a little potato-garden. Instead of being thankful to me for sparing you for a whole day, you begin to grumble because I won't let you stay out part of the night as well. But you always were ungrateful, from the time you were a baby.'

'But, aunt'—

'I won't listen to another word about it, Dolly! Back at six you must be; or, so sure as you stand there this blessed day, I never again will let you go to see this grand friend of yours. It's little good you'll get from her company, I'm thinking—a fine lady, set up with book-learning.' And Mrs Lynch, strong in the consciousness of being herself quite uncontaminated by book-learning, disappeared through the back-door, leaving poor Dolly standing in the middle of the spotless kitchen with a woe-begone face and eyes from which the tears were just ready to fall.

'Tis too bad, uncle,' she said, addressing an elderly man in a blue knitted jersey, who was seated on a bench just outside the open door, smoking a short pipe and reading the newspaper.

'A quarter of an hour won't make much difference, my girl,' he answered placidly.

'No difference to aunt,' replied Dolly; 'but it makes the difference of an hour and a half to me.—Don't you see, uncle, if I have to be back at six, I must leave Marshport by the half-past three train; but if I might stay out till a quarter past, the five train would do? It's very hard.'

'It do seem hard,' said her uncle in a meditative tone.

'If you were to speak to aunt'—

'Why, then, Dolly, haven't you lived long enough with your aunt to know that once she says a thing she sticks to it? She's a right good woman; in fact, there's few like her; but she do make up her mind uncommon tight.'

Perceiving that her uncle's intervention was not to be counted on, and indeed quite aware that it would be of little use, Dolly abandoned her attempt at coaxing him, and turning her attention to a little looking-glass that hung in a corner of the kitchen, began to readjust her black straw hat and crimson neck-ribbon. In spite of the plainness of the aforesaid hat, from which her aunt had just insisted on the removal of a large bunch of poppies, the picture that met her view was so satisfactory that Dolly for the moment forgot her grievance and smiled back at the reflection of her own round childish face. Presently her uncle, who had apparently been revolving the matter in his mind, spoke again.

'I tell you what, Dolly; if you were to ask Martin Delany to meet you at the railway station with his car, you might wait till the five train and be here by six all the same.'

Dolly paused to consider this scheme. 'No, no, uncle,' she said after a moment's hesitation. 'I'd sooner come by the early train than ask Martin Delany to do anything for me.'

'There's no one would do it more willingly, my lass, if you'd only think so. However, please yourself about that. I hope you'll have a pleasant day, even if it's not to be a long one.' And the old pilot, putting his pipe, still alight, into his pocket, took his way by a steep path cut in the cliff to the beach below.

It still wanted some minutes of the time at which Dolly ought to start in order to catch a train at the railway station, some two miles off, and she remained standing at the window, looking out over the sun-lighted sea and watching the tall masts of a ship in full sail sink below the horizon. She was roused by the recollection that it was time to be off, and looking up at the old-fashioned clock which stood in a corner of the

kitchen, she saw that it wanted five minutes to the hour when she should start.

'You old busybody!' she said half aloud, addressing the clock. 'But for you, aunt would never know whether I came home at six or half-past. If I could but stop you, or even— Oh! I wonder could I?' She hesitated a moment; then softly opening the back door, peeped cautiously out. Her aunt was in the little field behind the cottage, busily engaged in spreading clothes upon a hawthorn hedge to dry. Closing the door, Dolly mounted a chair in front of the old clock, and with trembling fingers moved back the hands exactly a quarter of an hour. Then, terrified at her own audacity, she hastily left the house and set off at a brisk pace in the direction of the railway station.

'I declare,' said Mrs Lynch as she entered the kitchen a few minutes afterwards, 'it's earlier than I thought.—What a hurry Dolly was in to be off. She might have waited a little longer. Not that she'd have been a bit of use dressed out as she was. Them girls are a terrible trial, to be sure.'

II.

According to the opinion expressed by the old clock, it still wanted four or five minutes of six when Dolly reappeared. Her aunt greeted her with a sniff of surprise. 'So you managed to be home in good time, after all. I hardly thought you would. So much the better for you, though. Here, take off your things at once. I'm ready to drop, from all I've had to do this blessed day.'

'So you waited for the five train, after all,' whispered her uncle as she passed, laden with the tea-tray. 'You must have run all the way from the station, child.'

'I did come very fast,' said Dolly, turning red.

'Twas a risk, my lass. Supposing now that the train had been a bit late, run your best and you would not have been here in time. However, you're all right, as things turned out.—Who's that coming up the path?' he added, as he caught sight of a dark figure at a little distance.

'It's Martin Delany again,' said Dolly in a tone of annoyance. 'I can't make out what he wants coming here so often.'

'It's easy to see what he wants,' said the old man with a chuckle; 'he wants you, Dolly.'

'I'm thinking he'll have to go on wanting me, then,' said Dolly, continuing to arrange the cups and saucers with a good deal of superfluous clatter.

'It's a pity you couldn't turn your mind to him, then; a fine young fellow like him with a good farm of his own.'

The entrance of its subject cut short this discussion. He really was a good-looking young fellow, tall and well built, with an open honest expression of countenance. He greeted Dolly with a mixture of friendliness and shy embarrassment, receiving decided cold-shoulder in return. Old Lynch and his wife, however, fully made up for their niece's want of cordiality, and in a few minutes all four were amicably seated at the tea-table.

'Did you see your friend, Dolly?' asked her uncle.

'O yes, uncle; and she's not a bit changed.

You wouldn't believe how glad she was to see me.'

'Who was that, Miss Dolly?' asked Martin.

'Don't you remember Ellen Farrell?' said Dolly, turning to him with more friendliness than she had hitherto shown. 'Her that was pupil-teacher in the National School here. She went to be nursery governess to some people at Marshport, and they took her abroad with them, and now she's come home quite a lady. Only think—she's able to speak French! I heard her talking to the French maid they brought home with them, and Ellen's French sounds nicer somehow than the Frenchwoman's.'

'Speaking French doesn't make a person a lady, Dolly,' said her uncle in a moral tone. 'There's sailors down at the port can curse and swear in half-a-dozen different languages. By-the-by, talking of sailors, we had a visitor to-day while you were out.'

'A visitor, uncle?'

'Yes, a sailor chap, a foreigner. Italian, I take him to be by his speech. He was a handsome fellow, with big dark eyes and white teeth, and dressed in bright colours like a girl. He had on a blue shirt, as bright, or brighter than Dolly's gown, and a scarlet cap and gold rings in his ears. He was a civil-spoken chap too; that is, as far as he could speak English at all. He had fallen on the rocks below, and cut his hand, and he came here to have it looked to. The Misses always has a soft spot in her heart for a sailor, because of our boy Tom, that's in foreign parts—so she bound it up for him, and tied one of my best handkerchiefs around it to make it look smart—and then she made him sit down and eat a bit of dinner with us. He was walking on to Marshport, he said. I couldn't make out what ship he belonged to; some foreign name that I didn't catch.'

'I'm sorry I wasn't here to see him,' said Dolly.

'Well, Dolly,' said her aunt, 'let it be a lesson to you to stay at home in future.'

'Miss Dolly doesn't often take a holiday,' said Martin.

'She doesn't often get one, Mr Delany,' said Mrs Lynch, 'nor won't, while I have the charge of her.'

Tea over, the two men established themselves, with their pipes on the bench outside the cottage door, while Mrs Lynch and Dolly put away the tea-things. The latter contrived to seize the opportunity of her aunt's momentary absence from the room to rectify the little bit of mischief she had accomplished in the morning, and enable the clock to maintain its hitherto unimpeachable character for veracity. Precisely as the usual nightly salute boomed out from the Admiral's flagship in the bay, the clock gave the first stroke of nine.

'Well,' said old Lynch, 'that is a wonderful clock, to be sure. There's hardly ever half a minute's difference between it and the gun; and when there is, I think it's the gun that do be wrong and not the clock.'

III.

Next morning as the Lynches were at breakfast, a neighbour rushed in breathless: 'Mrs Lynch,

ma'am, did you hear the news? Old Nelly Byrne's been murdered !'

'The Lord preserve us !' cried Mrs Lynch, 'Murdered ! Do you mean to say she's dead ?'

'Why, then, what would she be but dead ; and her money, that she kept hidden in the thatch, all gone. Sure, 'twas a foolish thing, as I often told her, to keep money by her in that way, and she living all alone. Couldn't she have given it to some one to keep for her ? But she was always that suspicious that she couldn't trust a human being.'

'She oughtn't to have been living alone at all,' said Mrs Lynch. 'Why didn't she go and live with Jim ? He asked her often enough, I know.'

'She didn't get on well with the daughter-in-law. She always thought that she, and Jim too, for the matter of that, were looking after the bit of money. Sure, 'tis she that's paid dear for her obstinacy.'

'Have they any notion who it was that done it ?' asked Michael Lynch.

'Little Maggie, Jim's little girl, was coming to see the grandmother, and just as she got to the top of the hill, she saw a man in a red cap coming out of the cottage. He came along the road towards her, and as he passed, she saw that he was dressed like a sailor. He was very pale, she said, and seemed scared like. She thought that he had gone into the cottage, as many a one does, just to ask for a drink of water or a light for his pipe ; but she never once thought of anything being wrong with the grandmother until she got to the cottage and found her stretched on the floor. Poor Maggie was so frightened that she set off at a run, and never once stopped until she reached home ; and by the time Jim and the police got to the cottage, the sailor of course was miles away. However, the police are after him, and they say they'll have him yet.'

'I hope they will,' said Mrs Lynch.—'Poor Nelly ; 'twas an awful end for her surely. A decent hard-working woman like her.'

The neighbour went away, anxious to be the first to impart such sensational news to as many as possible, while Mrs Lynch went about her work muttering inarticulate sounds expressive of pity and consternation.

Old Lynch smoked in silence for some time ; then he said : 'A sailor in a red cap. I hope it wasn't that chap that was here yesterday. I liked the looks of him.'

'So did I,' said his wife. 'He reminded me of Tom. I'm afraid, though, it must have been him.'

Later in the day two policemen called at the cottage bringing a coloured cotton handkerchief, marked with Michael Lynch's name, which had been found on the floor in poor Nelly's cottage. Lynch and his wife at once recognised it as the one given by the latter to the foreign sailor. The man had not yet been arrested, the police said, but would soon be, no doubt. They served Lynch with a summons to appear next day at the inquest, and, as they were going away, one of them said : 'You couldn't recollect, I suppose, sir, at what hour the man left this ?'

'I can then, just,' answered Lynch. 'He turned round at the door, just for all the world as you are doing now, and began asking some question. I couldn't understand him, his English was so queer,

and while I was trying to come at his meaning, the clock struck two. The moment he heard it, he nodded and smiled, and made signs that that was what he wanted to know. He went away at once after that.'

'The clock was right, I suppose ?'

'Quite right ; 'twas with the gun last night and the night before. There's not a clock in the three kingdoms that's more to be depended on.'

Next day, an Italian sailor, giving his name as Antonio Tedesco, was arrested, and at once identified by little Maggie as the man whom she had seen leaving her grandmother's cottage, and by the Lynches as the person to whom they had given the handkerchief. A curious old-fashioned thimble, known to have been among the old woman's treasures, was found in his pocket, and his clothes were slightly stained with blood. Another link in the chain of evidence was that some curly black hair, exactly corresponding to that of his beard, was found in the murdered woman's grasp. That there had been a struggle was evident from the condition of the cottage. The furniture was much displaced, and a clock which hung upon the wall had been pulled down, apparently by a frantic clutch at the weights. This clock had stopped at a quarter to three, thus showing the exact hour at which the murder had been committed. It was near four when Maggie Byrne had seen the man leave the cottage ; but this discrepancy was easily accounted for on the supposition that the intervening time had been spent by the murderer in a search for the money which the old woman was well known to possess. Tedesco's own story was that he had gone to the cottage to ask for assistance in securing the bandage on his injured hand, it having become loose, and had been horrified at finding the old woman stretched on the floor and covered with blood. He had gone over to her to try if he could give her any help ; but finding that she was quite dead, and fearing that suspicion might rest on himself should he be found in the cottage, he had left at once and made the best of his way onwards. The thimble he had picked up on the road. This explanation was of course generally disbelieved ; and the verdict of the coroner's jury was one of wilful murder against Antonio Tedesco.

Dolly meanwhile was out of reach of the excitement caused by this event. On the day following that of the murder, another of her aunts, Michael Lynch's sister, had taken ill, and Dolly had been sent for to help in nursing her. She went very willingly, as she was fond of Mrs Driscoll, who had always been kind to her ; and in her anxiety for her aunt's welfare she ceased to take much interest in the details of the tragedy which had been enacted so close to her home. Moreover, the Lynches were bad correspondents, and newspapers seldom found their way to Knockgrennan Farm, so that Dolly knew little beyond the fact that old Nelly Byrne had been murdered, and that the murder was supposed to have been committed by the Italian sailor.

IV.

When Dolly returned home after six weeks' absence, she found the murder again the chief subject of interest. The trial was to take place on the following day, and Michael Lynch and his wife

had been summoned to appear as witnesses. This entailed an entire day's absence from home, the assize town being some sixteen miles distant; and Mrs Lynch thought it necessary to make as many preparations as if she had been going to emigrate. Dolly, who was to be left in charge, was scarcely as much impressed as her aunt would have wished by the importance of the trust committed to her; but she made many promises of steadiness and vigilance, and bade farewell to her aunt and uncle with becoming solemnity. Then, having despatched her light household duties, she sat down to make a dress for herself, taking advantage of her aunt's absence to secure a more fashionable cut than that lady would have at all approved of. Absorbed in her work, she sat over it until past mid-day, when she was disturbed by two young men, the owners of a yacht which lay at anchor a little way off, coming to beg for a light for their cigars.

'How cool and comfortable 't is here,' said one of them.—'May we sit down and rest a bit on this bench outside the door, Miss Dolly?'

'To be sure, sir,' said Dolly, resuming her own place at the window, while the two young men established themselves outside and began a desultory conversation. For a time Dolly paid no attention; at length, however, she found that they were talking of the murder, and she began to listen.

'Carroll is defending him,' said one. 'It will be a good thing for Carroll if he gets him off; but I am afraid the evidence is too strong.'

'The evidence seems little to hang a man on.'

'They hanged a man here last year on quite as little. Carroll means to maintain that it is impossible he could have walked from here to the foot of Killforlane Hill, where the murder was committed, in three-quarters of an hour.'

'What has the time it took him to walk there to do with the case?'

'Don't you see? The clock in the old woman's cottage was pulled down in the struggle, and stopped at a quarter to three, thus marking the exact time of the murder. Now, Lynch says the man did not leave this until two; so that if it was impossible for him to walk the distance in the time, it is likewise impossible that he can have committed the murder.'

'I see. Perhaps the clocks were wrong, though.'

'Not Lynch's clock; it is infallible; never made a mistake in the whole course of its existence. Lynch would stake his own life, or any one else's, on its infallibility. Seriously, though, it must have been right on the day in question, for Lynch remembers comparing it with the gun that night and the night before.'

'I'm afraid it's a bad lookout for Carroll's client.'

And the young men, having finished their cigars, nodded to Dolly and went away.

Dolly had listened with some amusement to their assertions concerning the infallibility of the clock, remembering as she did the day on which she had caused it to bear false witness in her behalf. Suddenly the thought flashed into her mind: Was not that the very day of the murder?

Her head turned giddy and her heart stopped

beating as she remembered that it was. She put her hands before her face, trying to collect her thoughts, but for some time she was too confused to understand in what manner the knowledge in her possession would bear on the facts of the case. Being naturally clear-headed, however, she soon perceived that as she had put back the clock a quarter of an hour, at the time her uncle believed it to have been two o'clock, it must in reality have been a quarter past; and that if it were doubtful that the man could walk a certain distance in three-quarters of an hour, it was clearly impossible that he could do so in two-thirds of the time.

What was she to do, or to whom was she to apply for help? Her first impulse was to run after the two young men; but on looking out, she perceived that they were already half-way out to the yacht in their punt. Then she remembered Martin Delany. At another time, or for any more trifling cause, she would have shrunk from applying to him; but now the mere thought of him seemed to give her courage and confidence. Snatching up hat and shawl to put on as she went, she set off at her quickest pace towards Delany's farm, which was some half-mile distant. As she approached the farmhouse, she caught sight of Martin in a large meadow, giving vigorous assistance to the labourers who were saving a late crop of hay. She ran over to him at once; but by the time she reached him she was too breathless to speak. Much frightened, Martin made her sit down upon a haycock, and filling a cup from the can of milk left for the haymakers, he put it to her lips. In a few moments she had recovered breath to tell her story in short broken sentences. Martin was slower in taking in its full meaning than she herself had been; but once he did understand, his action was prompt and decided.

'We must go up to town at once, Dolly,' he said, 'and see the prisoner's lawyer. He'll know what's best to be done. Come into the house with me, and Margaret will make you a cup of tea while I put the horse in the car. We must drive straight to Marshport; it will be quicker than waiting for the next train.'

'But how can I leave the house to itself? There's not a soul in it, and the door wide open.'

'We'll ask Margaret to go and mind the house while you're away. She will, I know.'

'Aunt will be so angry,' said poor Dolly.—'O Martin, will she hear what I did to the clock?'

'I'm afraid she must, Dolly.—But never mind; she can't be very angry. Anyway, it's a matter of life and death to this poor man, and you must tell all you know about the matter, cost what it may.'

'I know that,' said Dolly. 'I'd have told long ago, if I'd understood that it made any difference.'

By this time they had reached the house; and Margaret Delany, a pleasant-looking, sensible young woman, on a few words of explanation from her brother, readily consented to take Dolly's place for the day. In a few minutes Martin had brought round the car, drawn by his own riding-horse, an animal usually considered far too valuable to go in harness; and Dolly was soon established on one side of the car, a shawl

round her feet, while Martin, whip in hand, mounted the other.

V.

At another time, Dolly would have enjoyed the rapid drive; but now her only sensation was one of terror at the ordeal before her. At the end of a two hours' drive they began to approach the city. Country seats changed into villa residences; these, again, gave place to terraces, which in their turn merged into streets. At length they reached the heart of the city, and pulled up at the door of the court-house. Making their way into the close crowded court, Martin, after a good deal of argument with a policeman, succeeded in sending a message to the prisoner's solicitor which brought that gentleman to them without delay. After a few hurried questions, he desired Dolly to follow him; and in a few minutes she found herself upon the witness table, her limbs trembling so that she could scarcely stand, judge, jury, and barristers being visible only through a mist.

A few skilfully put questions from the prisoner's counsel elicited the whole story. This comparatively easy business was, however, followed by a searching cross-examination from the counsel for the Crown, who insisted on sifting her motives for tampering with the clock, and her reasons for concealing the fact until now. The terrible truth concerning the clock once known, however, she had nothing to hide, and so came successfully through the ordeal, the fact that she had never even seen the prisoner telling in her favour as a disinterested witness. When at length she was allowed to go down, her uncle, who was waiting for her, took her out of court; and Mrs Lynch, whom nothing short of the judge's presence could have restrained hitherto, began to give Dolly what she called a piece of her mind.

'Well, Dolly, I wouldn't have believed in such wickedness even from you.'

'Don't scold her now, Mrs Lynch,' said Martin authoritatively. 'She's very tired, and she has eaten nothing since morning.—Where are you going to dine, sir?' turning to old Lynch.

'With the Missus's cousin, Mrs Burke—her that keeps a grocer's shop in the New Street.'

'Then you had better take Dolly there at once, sir. I'll wait and bring you word how the trial ends—not that there's much doubt of it now.'

Mrs Burke was a stout, kind-hearted old woman, somewhat higher in the social scale than her cousin, the pilot's wife. Knowing nothing of Dolly's iniquities, and perceiving that she was tired and upset, she made a great fuss about her, and insisted on her resting on the sofa in the parlour behind the shop. As Dolly lay there sipping her tea, and watching the elaborate manner in which Mrs Burke's servant, under the supervision of her mistress, was laying the cloth for dinner, a confused sound of cheering was heard in the street outside, and old Lynch went to see what it was about.

'It's the foreign chap,' he said, coming back in a few minutes. 'They've acquitted him, and the people are following him down the street. I'm glad he's not to be hanged, anyway.'

Martin came in soon after, bringing particulars of the verdict. 'The judge charged in his favour; he told the jury that if they believed Dolly's evidence, they had no choice but to acquit the

man; and they brought in a verdict of "Not Guilty" without leaving the box.—He may thank Dolly for that.'

'He may thank Dolly for being six weeks in jail. If she had not meddled with the clock that day, me and her uncle would have known that he didn't leave the house till after two, and we'd have said so at the inquest; and he'd have been let off then and there.'

'I hardly think he would, Mrs Lynch. The coroner's jury would have sent him for trial all the same.'

'Anyhow, Dolly's had a lesson that she won't forget in a hurry,' said her uncle. 'She'll never tell a lie again.'

'I didn't tell a lie, uncle,' exclaimed Dolly.

'You made the clock tell one for you, my lass, and that was just the same, according to my reckoning.'

Dolly turned scarlet.

'She didn't think of it in that light, sir,' said Martin kindly.

'No; I don't think she did. Whatever her faults may be—and I'm not denying perhaps that she has as many as other people—she always tells the truth.—What became of the poor foreign chap, Martin? He'll be dazed like, getting his liberty all of a sudden.'

'He's all right, sir; the Italian consul was in court, and he's looking after him.'

On the way home that evening, Dolly made an effort to express her gratitude to Martin for the kindness he had shown her.

'Don't think of it, Dolly,' was the answer. 'Any one would have done the same under the circumstances; and you know well that I'd do ten times as much any day only to give you a moment's pleasure.'

'I never knew till to-day how good you were,' said Dolly; and Martin went home that night feeling happier than he had done for months.

A fortnight later, Dolly came to her uncle to tell him that she had promised to marry Martin.

'I'm right glad to hear it, my girl,' said Lynch; 'you couldn't have a better or a kinder husband. All I'm afraid of is, that you don't rightly know how to value him.'

'I think I do, uncle,' answered Dolly.

PERFECTION.

PRET not for Fame, but in Perfection rest.
Seek not the first, but the most excellent;
For thus it proves, when toils and cares have spent,
The first is often second to the best.
With patient spirit and unyielding zest
Toil to complete each daily task, Heaven-sent,
Rather with little ably done content,
Than lost in barren fields of fruitless quest.
For as in every grass and leaf and flower
God's work surpasses man's, so man is next
To God, when, spurning gold and fame and praise,
He takes a daisy as his daily text,
Strives simply, unassumingly, each hour,
To inform with beauty Life's uncomeliest ways.

THE PRINCESS CARABOO.

A STRANGE HISTORY.

MANY are the tales of literary impostures and of those who manufactured them. Psalmanazar, with his 'History and Description of the Island of Formosa,' and his 'Dialogues between a Japanese and a Formosan;' Lauder and his vilification of Milton in 'An Essay on Milton's Use and Abuse of the Moderns in his Paradise Lost,' the forgeries in which he admitted on the 28th of November 1750; Chatterton, whose name is a 'household word;' Macpherson with his Ossian; Ireland with his Shakespearean impostures; and the modern forgeries attempted to be sold by Shupira, are all well known to us. But Caraboo, who invented a new country and a new language, should surely rank among them, equal at least, in such questionable society, to George Psalmanazar. Yet she is little known, although her imposture was of the most daring kind, such as one would think could never have emanated from a person in her position in life; and, were it not true, the narrative of her life might well seem incredible, and be consigned to the regions of romance.

It was on the evening of Thursday, April 3, 1817, that a young woman, rather unusually dressed, entered a cottage in the parish of Almondsbury, in the county of Gloucester—a village in which is said to be the burial-place of Almond, father of King Egbert—and made signs that she wished to sleep there; but, speaking no known language, she was regarded with suspicion, and the overseer of the poor for the parish probably did the best thing he could under the circumstances: he went up to the great house of the district, Knole Park, to consult with its owner, Samuel Worrall, Esq., who was a magistrate for the county, and who had an accomplished Greek man-servant, who was conversant with several foreign languages. The upshot of their conversation was that the young person was brought up to Knole mansion; but she showed great disinclination either to go

thither or to enter the house. The polyglot man-servant could make nothing of her language, and somehow they persuaded her to empty her pockets, in order to see whether anything could be found to lead to her identity; but she could only produce a few halfpence and a bad sixpence, her bundle containing but a few necessaries and a piece of soap.

She was dressed very much like an ordinary country girl, in a black stuff gown, with a muslin frill round her neck, a black cotton shawl on her head, and a red and black shawl round her shoulders; both of which, in a sort of imitation of Asiatic costume, she had put on loosely and somewhat tastefully. She also wore, as was then usual, black worsted stockings and leather shoes; so that there was nothing particularly oriental in her clothing; but her personal appearance and manners were somewhat prepossessing. She is thus described: 'Her head small, her eyes and hair black, forehead low, nose short, complexion a brunette; her cheeks faintly tinged with red, mouth rather wide, white teeth, lips large and full, under lip a little projecting, and her chin small and round. Her height about five feet two inches. Her hands were clean, and apparently unaccustomed to labour. No earrings, but the marks of having worn them. Her age appeared about twenty-five.'

What to do with this interesting stranger they scarcely knew; but for the night she was sent to sleep at the village inn, where she had tea in preference to any other beverage. On being shown her bed, she made signs that she was used to lie on the floor; but once in bed, she seemed to appreciate it much, and retired to rest after kneeling down to her evening's devotions.

Next morning she was visited both by Mrs Worrall and the clergyman of the parish; and on being shown some prints descriptive of China, she seemed to brighten up, and made signs that it was not a boat, but a ship, that brought her to this country. Mrs Worrall kindly took her home with her, when she refused all animal food, and would only drink water, expressing great delight

at some furniture with Chinese figures painted thereon, and by her gestures intimated that they were similar to the people of her own country; also by pointing to herself, and repeatedly saying 'Caraboo, Caraboo,' endeavoured to explain that it was her name.

She was taken to Bristol, was fruitlessly examined by the mayor, and lodged in St Peter's Hospital, a refuge for vagrants and the poor of Bristol; but whilst an inmate of this institution she refused nourishment of any kind, nor would she sleep in a bed during the time of her sojourn there. Mrs Worrall, seeing this, had her removed to her husband's offices at Bristol, and there she remained for ten days under the charge of Mrs Worrall's housekeeper.

All efforts to discover her language, and thus converse with her, were ineffectual, until she was visited by one Manuel Eynesso, a Portuguese from Malacca, who happened to be in Bristol, and he said he could understand her, and would interpret for her: that the language she spoke was not pure, but a mixture of languages used on the coast of Sumatra and other eastern islands. Now that something apparently tangible was found out about her, Mrs Worrall took her back with her to Knole, where a gentleman who had made several voyages to the East Indies, and knew something of China, took a great interest in her, and elicited from her signs and gestures at various times the following extraordinary story.

Her name she said was Caraboo, and that she was the daughter of a person of rank, of Chinese origin, by a Mandin or Malay woman, who was killed in a war between the Boogooos (cannibals) and the Mandins. She lived on an island called Javasu, and one day, whilst walking in her garden attended by three women, she was seized by the crew of a pirate prahu, bound hand and foot, and her mouth being covered, she was carried off. Her father jumped into the sea and swam after her, discharging an arrow at her captors, which, unfortunately, killed one of her women who were taken on board with her. She did not tamely submit to this outrage; but, according to her own account, wounded two of the prahu's crew with a kris, one of whom died from the effects of his wound. On this prahu she was kept by the pirates for eleven days, when she was sold to the captain of a brig and transferred to that vessel. After a four weeks' voyage they arrived at and anchored in a port which was supposed to have been Batavia. Having remained there two days, and taken on board four females, they set sail; and after a voyage of five weeks arrived at another port which was supposed to have been the Cape of Good Hope, where they landed the four women. After a stay of three days, they sailed for Europe, which was only reached after a voyage of eleven weeks. The first land made was, according to this mirror of truth, some part of the coast of England; and having been ill-treated on the voyage, she took the determination of jumping overboard and swimming ashore. Her clothing, according to her own account, does not seem well fitted for such a project, for on leaving the vessel she was attired in a gown worked with gold, a shawl of similar materials was over her head, and in this costume she achieved her freedom.

She seems to have felt the singularity of her dress, for she went to a cottage with a green door and exchanged it with a woman for her present clothes. Thus disarming curiosity, she wandered about the country for six weeks, sleeping at various houses, until she found herself at Almondsbury.

After a time she became very communicative as to her antecedents, and described her mother's teeth as being blackened—probably by the chewing of betel—her face and arms painted, having a jewel in her nose, with a gold chain from it to the left temple. Besides her mother, her father had three other wives, and he was carried in a palanquin, which was borne on men's shoulders. She did not describe his costume, but only his ornaments, which according to her account consisted of a gold button in his cap, with three peacock's feathers on the right side of his head, a gold twisted chain round his neck, to which was suspended a large square locket of amber-coloured stone set in gold.

She said that in her own country of Javasu she wore seven peacock's feathers on the right side of her head. Her patrons gave her some calico, and she made herself a dress such as she had been accustomed to wear. It was somewhat short in the skirt, as it did not reach to her ankles; but the sleeves were very wide, and would reach the ground but that they were confined to the wrist. She had a scarf round her waist, which was embroidered, as was also the bottom of her dress, round her bosom, and the open part of the sleeves. She was barefoot, with the exception of sandals with wooden soles.

During her residence at Knole she cooked all her own victuals, preferring rice to bread. She would eat no meat, and only drank water or tea. But she was fond of curry, which she made in a very savoury manner, and she would also occasionally eat fowl or fish; but these she cooked herself, cutting off the heads and burying them in the ground. She always prayed night and morning, and rigidly fasted every Tuesday; but she was very fond of quasi-athletics, such as fencing, dancing, &c.

She had been three weeks at Knole, when one day she was amissing, but returned again in the evening with her hands and feet dirty and a bundle of clothes, after which escapade she fell ill. On the 6th of June she again took to flight; and it being discovered that she had gone towards Bath, Mrs Worrall proceeded in pursuit. Here she found her protégée the *soi-disant* Princess of Javasu in the drawing-room of one of the leaders of fashion in Bath, which was crowded with fashionable visitors, all eager to be introduced to the interesting and illustrious stranger. One fair lady was kneeling before her, another holding her hand, a third begging for a kiss; and she was posing delightfully when Mrs Worrall entered the room. Then, for an instant, her *sang-froid* forsook her and she burst into tears, but soon regained her composure.

This was her culminating point, and henceforward her career was downward. But before entering into the details of her antecedents, let us glance briefly at her literary forgery. She not only drew a chart or map of her voyage from Javasu, but she invented a language for this shadowy realm; and its written characters are

wonderful to behold, having affinity to nothing known on this earth. With two exceptions: she gave the name of God as Allah Tallah, and in her vocabulary it is the Arabic Alla, the other is the Arabic 'ta 'Alla' (may He be exalted). But these are the sole exceptions. Heaven was Saunen; earth, Tarsa; one, two, three were Eze, Duce, Trua; fire, Apa; water, Ana; the sun, Sanatoo; and so on *ad infinitum*. The Arabic she had probably copied from some oriental book shown her, but she made a grievous error in her language; she introduced therein a few gypsy and slang words, such as Moshah, a man; Raglish, a woman; Goshah, a landlady; Tance, a halfpenny; Win, a penny; Tanner, a sixpence; Bob, a shilling; Junk, two shillings; Bul, five shillings, &c.; thus showing that no one is at all moments wise.

Now for her fall. A Dr Wilkinson of Bath had written to the *Bath Chronicle* about this curious foreign woman, and the letter was republished in the *Bristol Journal*, where an old landlady of Caraboo's, named Neale, saw it, and communicated with Mrs Worrall on the subject. Mrs Worrall took Caraboo over to Bristol, not telling that young woman what she was going to do. Having had an interview with Mrs Neale and her daughters, she went into a room alone with Caraboo, and told her of the proofs she had obtained of her imposture. The Princess tried to mollify her by talking her gibberish to her benefactress; but the latter would stand no nonsense, and threatened to call Mrs Neale up-stairs and confront her. Then she acknowledged her fraud, begging that Mrs Worrall would not cast her off or suffer her father to be sent for. That lady promised this on certain conditions, one of which was, that she should give a faithful detail of her former course of life, disclose her real name, her parentage, and history. But although she professed to do so, her untruthful habits were so ingrained that she only mingled truth and fiction. A little time afterwards, however, she made a confession, which in many circumstances was afterwards brought out to be a true one.

She said her name was Mary Baker—it was afterwards found to be Wilcocks—that she was born at Witheridge, in Devonshire, in 1791, and had received no education, leading a sort of tomboy existence. At the age of sixteen she obtained a situation at a farmhouse, where she lived for two years, when she left because they would not raise her wages from tenpence to a shilling a week. She then returned home; but ran away because her parents used her ill for giving up her place, and went to Exeter. There she went into service as a general servant at eight pounds a year. She only stayed there for two months, when she left and went home again. With part of her wages she bought herself a white frock, which finery her mother insisted on her taking off, as she was sure she had procured it dishonestly. Unable to endure this imputation, she decamped, and returned to Exeter.

Thence she wandered about the country begging, sometimes getting assistance, at other times being chidden and threatened with the horse-whip, or imprisonment as a vagabond, so that her life being a burden to her, she thought of hanging herself. This she did not do. Having met with a sympathising old gentleman who gave her five shillings, she went into lodgings, and rested for

three days in Taunton. She wandered on until she came to London, where, sick and weary, she sat down on the steps of St Giles's Hospital or workhouse. She was taken first to the watch-house, where the hospital doctor having seen her, ordered her removal to the infirmary. There she remained for several months, ill of brain-fever. When recovering from this attack, and whilst still very weak, she attempted to carry a kettle of boiling water, which upset, and so scalded her that she had to keep her bed for a month; and afterwards, when she was sufficiently recovered, by the interest of a clergyman she got a place, which she kept three years.

During the whole of that time, she said, she never went out. Being one day desirous of going to a Jew's wedding, she forged a letter from a shopkeeper known to her employers, begging them to allow Mary to go to a christening. Of course she went to the wedding, but returning home at proper time, was questioned as to the particulars of the christening. Her mistress having some doubts as to the correctness of her answers, made inquiries for herself, and the truth came out. Of course she left. And now comes an extraordinary part of her story. She had observed the Magdalen in Blackfriars Road, and thinking it was a nunnery, resolved to enter it. Finding that application was to be made on the first Wednesday in the month, she went, and was asked many questions which she said she did not understand. But her answers evidently satisfied the authorities; she was admitted, and being clothed in uniform, was utilised as a house-maid. There she remained for six months, when she was expelled.

She then dressed in male costume and tried to get employment; but her size was against her. Whilst in this masquerade, she was met by two highwaymen on Salisbury Plain (so she said), and consented to be their servant and look after their horses. But they soon got rid of her, giving her some money. She then resumed female attire, and paid her parents a visit, got another place, stayed three months, left; entered service again, left, and started for London. Here she got a situation, and (she said) married a foreigner named Bakerstendit (which she shortened to Baker). He deserted her, and went abroad, and she went to the City Road Hospital and was confined. She got her child into the Foundling Hospital, where it soon died.

More service, another return home, which, of course, she soon left, and more vagabondage, including a stay with gypsies. This time she endeavoured to act the part of a foreigner, and tried to get a passage to America; but it was too much for her finances. She took to wandering, and turned up at Almondsbury. We know her career from this point. Her parents were communicated with; and although her statements were not altogether corroborated, they were borne out in the main points.

It often happens that much more commiseration and practical sympathy are shown to people of worthless character than to those of exemplary life suffering from misfortune; and Caraboo was an instance of this. A living fraud, yet she found helping hands, who almost gratified her every wish. She wanted to go to America; straightway an outfit was given, and a passage was taken for

her in a vessel from Bristol to Philadelphia, and she was handed over to the care and protection of some fellow-passengers, Moravian teachers, who were authorised, if her conduct during the voyage was good, to give her pecuniary assistance in addition to that with which she was already furnished. Before she sailed, she was the object of public curiosity. Noblemen came to see her; and she was visited by persons of all descriptions—natives and foreigners, linguists, painters, physiognomists, craniologists, and gypsies—all anxious to see and converse with this female Psalmanazar.

She duly arrived in America; but did not end her days there. She returned to England in 1824, and took apartments in New Bond Street, where she publicly exhibited herself at the rate of a shilling a head; but she had passed out of the public mind, and her show did not draw. A writer in the *Times* of January 13, 1865, says that she 'retired into comparatively humble life, and married. . . . The quondam "princess" died recently at Bristol, leaving a daughter.' Mr George Pryce, of the City Library, Bristol, writes in *Notes and Queries*, April 15, 1865: 'The last I heard of her, she was married, and once more took up her residence in this city, where her latter days were spent very creditably as an importer of leeches, and in applying them, when requested, by her customers. She appears to have died about the close of the year 1864, leaving an only daughter. I believe the exact date of her decease is unknown, as well as her age and place of interment.'

'Bristolensis,' in *Notes and Queries*, May 20, 1865, confirms the foregoing, and adds: 'She avoided as much as possible any conversation with regard to her former career, of which, I think, she was much ashamed; and nothing annoyed her more than when a neighbour's child ventured to call after her, 'Caraboo.'

A DEAD RECKONING.

CHAPTER XV.

GERALD BROOKE having relieved his 'mate' Lucas at the signal-box, and having satisfied himself that his lamps were properly trimmed and set for the night, sat down in his box to read. The night duties at Cinder Pit Junction were not of a very onerous nature. The last passenger train from Cumberhays, which also carried the mail, passed at eight-thirty; and the last train to that place till the arrival of the morning mail, at a few minutes past ten o'clock. In the course of the night two or three trains of mixed merchandise and minerals passed through without stopping, and these, together with a train from the collieries bound for the South, comprised the whole of the nocturnal traffic. Thus it fell out that Gerald had plenty of spare time on his hands, and always brought a volume with him to help to while the long dark hours away.

The signal-box, the entrance to which was reached by a flight of eight or nine steps, stood on a small space of cleared ground by the side of the line. A little way back was a low embankment crowned by a hedge, overshadowed here and there by an umbrageous beech or elm, beyond which the open fields stretched far and wide. Few places could be more solitary and deserted; not a house, not a habitation of any kind was

within ken; but by day a haze of smoke in the distance told of life and labour not far away.

The last train from Cumberhays had passed more than an hour ago, the next one would be the train going the reverse way. Gerald sat reading, but with his ear on the alert for the ting of the telegraph bell which should tell him when the coming train had passed Mellingfield, the nearest station south, five miles away. All at once he was startled by the sound of some one coughing, evidently just outside his box. It was a sound so unexpected and surprising in that lonely spot and at that hour of the night, that he sprang to his feet, while his nerves began to flutter strangely. Next moment there came a loud rapping at the door, as it might be with the handle of a walking-stick. Gerald opened the door at once; and then he saw a portly middle-aged man dressed in black, with a white cravat and spectacles—to all appearance a clergyman—standing at the foot of the steps and gazing blandly up at him.

'My good man,' said the stranger in unctuous but well-bred accents, 'I am a stranger in these parts, and am sorry to say that I have lost my way. I want to get to a friend's house at Overbarrow; no doubt you can put me in the right road for doing so?'

'You must cross the line'—began Gerald.

'My good man,' interrupted the stranger, 'I am somewhat deaf, and cannot hear what you say. I wish you would be good enough to come a little nearer. With my defective eyesight, I dare not trust myself up these steps of yours.'

Gerald stepped down without hesitation. 'You must cross the line,' he began again in a somewhat louder key, 'and about twenty yards farther on you will find a gap in the hedge.'

'Yes, yes—a gap in the hedge; I understand,' responded the other eagerly.

'And after that you will find a footpath which will bring you to the high-road. Then'—

Not a word more spoke Gerald. A soft heavy cloth of some kind was suddenly thrown over his head, while at the same instant his arms were pinioned firmly from behind, and a cord with a running noose was drawn tightly round his legs. The attack was so sudden that he was powerless to make the least resistance, and in less than half-a-dozen seconds he found himself as helpless as a babe. Then a corner of the cloth that enveloped his head was raised and the sham parson said in his most oily tones: 'My friend, if you have any regard for your life you will neither cry out nor attempt to make the least disturbance. Be obedient and good, and no harm shall befall you.' As if to add emphasis to the warning, Gerald was lightly rapped on the knuckles with what he could feel to be the chilly barrel of a pistol. Then with a man on each side of him holding him by an arm, he was conducted to the background; and having been planted with his back to a tree, he was bound firmly to it with several folds of thin cord. The cloth which still enveloped his head was fastened loosely round his throat, so as not greatly to impede his breathing; but his voice would have been smothered in it had he even been in a position to call for help.

He had no means of ascertaining the number of his assailants, but as far as he could judge

there must have been three or four of them. He was lost in a maze of the wildest conjectures as to what the object of the attack could possibly be. Apparently none of the gang had recognised him as Gerald Brooke, the man for whose capture so large a reward was still unclaimed. Yet why, then, had they made him a prisoner? What object was to be gained by his capture? Never in his life had he felt so utterly perplexed. He could hear an eager conversation going on a little distance away; but all sounds now came dull and muffled to his ears.

As already stated, the gang had previously separated into two parties. Three of the men, at the head of whom was Crofton, had made their way down the branch to a point close to where, as nearly as they could judge, the driver of the train would be able to pull up as soon as he found himself on the wrong line of rails. The other three men, with the sham parson as their chief, had been detailed for the capture of the signalman, the result of which we have seen. After a little talk together, one of the three now started off down the branch to carry the news to Crofton and the others.

Slinkey at once took possession of the box, and proceeded to test the working of the various levers, in order that there might be no hitch when the critical moment should arrive. He was an ex-railway servant and thoroughly understood what he was now about.

The sham parson was known familiarly among the 'profession' which his eminent talents adorned under the pseudonym of 'Lardy Bill,' a title conferred upon him in the first instance by reason of his fondness for swell clothes, flash jewelry, and scented pocket-handkerchiefs. He was one of the most clever and unscrupulous rogues of which the great Babylon could boast; but it is pleasant to be able to record that despite his cleverness, a considerable portion of his knavish existence had already been passed in an enforced seclusion where board and lodging had been provided him free of charge. His appearance was eminently in his favour. He was a well-built, ruddy-checked man, with a moist and humorous eye, and a sort of hail-fellow-well-met air. He had the suggestion of a man who could tell a good story and appreciate a good glass of wine. He looked equally at home when made up as a clergyman, a gentleman farmer, a staid City magnate, or a poor tradesman who had fallen upon evil days. He had always *les larmes dans le voix* at command when the occasion needed them, and he could choke a sob in his throat as cleverly as any low comedian on the stage.

As soon as the two men were left alone, with their prisoner in the background, Lardy Bill lighted a cigarette—he liked to follow the fashion in everything—and began to stroll up and down the narrow clearing on which the box was built. Slinkey was too nervous to follow his companion's example. 'As I calculate,' he said, 'we ought to have had the signal from Mellingfield three minutes afore now. Can anything have happened?'

'Pooh, man—what is likely to have happened?' said the other coolly. 'These beggarly branch trains are nearly always late.'

Half a minute later they heard the welcome ting-ting announcing that the train had just passed Mellingfield.

'She'll be twelve minutes or more yet afore she's here,' remarked Slinkey as he again ascended the steps and entered the box.

Presently Lardy Bill tossed away the end of his cigarette, and crossing to his prisoner, examined his bonds and satisfied himself that they were still intact. On going back to the box he was rejoined by Slinkey, who now proceeded to go down on one knee and rest his ear on the rail. 'She's coming; I can hear her quite plain,' he said after a few moments. 'Another five minutes and she ought to be here.'

'Then I'll hurry off to the others,' said Lardy. 'I shall be wanted there when the shindy comes off, and you'll manage here by yourself all right.'

'Right you are,' responded the other. 'As soon as ever the train's past, I shall cut the wires, and then make a bolt of it, and wait for you fellows at the cottage.'

Nothing more was said. Lardy Bill started at a quick pace down the branch, while Slinkey re-entered the box.

Neither of them had the slightest suspicion that for the last ten minutes or more all their actions had been watched by an unseen witness; but such was the case. When Clara Brooke, to her intense dismay, discovered that not her husband, but a stranger, was the occupant of the box, she felt for a little while as if her heart must die within her. Then she became aware of two dusky figures standing a little distance away, whom she rightly concluded to be other members of the gang; but still her husband was nowhere to be seen. She had arrived on the spot almost immediately after Gerald had been bound to the tree; but the night was too dark to admit of her seeing him from that distance. She felt at once that she must get round to where the signal-box stood, on the opposite side of the line, and, if it were possible, approach near enough to the men to overhear their conversation, and by that means discover what had become of her husband. No sooner was the thought formulated in her mind than she began to put it into practice. Still keeping in the shelter of the hedge that ran parallel with the line, she sped as fast as her feet could carry her to a point some forty or fifty yards farther down the line, far enough, as she judged, to be out of the range of vision of any one who might be on the lookout at the box. Here, after drawing her shawl over her head—she had discarded her bonnet some time before—she broke through the hedge, was across the line in three seconds; and then, after pushing through the hedge on the opposite side, she turned back in the direction of the signal-box, she and it being both now on the same side of the line. Creeping forward foot by foot and yard by yard, she presently found herself a little way behind the box, and within a dozen yards of her husband, had she only been aware of it.

While this was happening, one of the men had gone off to join the others down the line. Clara, peering through the interstices of the hedge, could see the two remaining men walking and talking together, but was too far away to distinguish what they said. Not long had she watched and waited when she heard the ting-ting of the telegraph bell. She knew that it was a signal of some kind, but not what its precise meaning

might be. Then one of the men disappeared into the box, while the other—it was the one, she could now make out, who was dressed like a clergyman—turned, and seemed as if he were marching directly towards her. Terror-stricken, she dropped completely out of sight behind the hedge-bank, expecting every moment to feel a hand laid on her shoulder. But nothing coming, she breathed again; then her head went up till her eyes were on a level with the top of the bank; then, to her surprise, she saw that the man seemed to be carefully examining the trunk of a tree some little distance away. She strained her eyes in the endeavour to see what he could possibly be about, and then suddenly her heart gave a great bound. The trunk of the tree was defined like a faint silhouette against a background of star-lit April sky, but it was a silhouette which in one portion of its outline bore a startling resemblance to a human figure. As by a flash of divination, Clara knew that it was her husband she was gazing upon. Her breath fluttered on her lips like a bird trying to escape, and she set her teeth hard in the flesh of her arm, to stifle the cry that broke involuntarily from her heart.

After a few seconds the man went back; and after saying a few words to his confederate, he apparently took leave of him, and starting down the branch, was quickly lost to view; then the other at once went back into the box. Now was Clara's opportunity.

Half a minute later she was by her husband's side. Laying a hand softly on his arm, she said in a low voice: 'Gerald it is I—Clara.' Some smothered sounds came back to her; and then she discovered, what the darkness had hitherto hidden, that her husband's head and face were closely muffled. Her trembling but skilful fingers quickly undid the knots and removed the covering. Gerald gave a great gasp of relief as he drew a deep inspiration of the cool night-air. Then he whispered: 'You will find a knife in my outside pocket.' In a minute from that time he was a free man.

Slinkey, waiting alone in the signal-box, had tried the lever again and again by means of which the points were opened that would turn the train on to the branch, and had satisfied himself that everything was in working order. Both the distance and the home signal-lamps showed the white light, so that the train would speed on unsuspectingly with unslackened pace. Slinkey at the best of times was a nervous timid creature—a man who walked ever in trembling dread of the hand which he knew would some day be laid suddenly on his shoulder—but now that he was left alone, now that he had no longer Lardy Bill's audacious bulldog courage to help to animate his own, his craven heart sank lower and lower, and he would have given a year of his life to be well out of the adventure into which he had allowed himself to be seduced.

The low deep hum of the oncoming train grew palpably on the ear. Instinctively, Slinkey's hand closed on lever No. 3, while his heart began to beat a sort of devil's tattoo after a fashion that was far from comfortable. Suddenly he gave a great start, and for a moment or more the tattoo came to a dead stop. He had heard a sound that he remembered full well: it was the noise caused

by the explosion of a fog-signal. At the same instant the engine began to whistle its shrillest. Then came the explosion of a second signal, and then the whistle ceased as suddenly as it began. And now he could faintly hear the soft rhythmical pulsing of the engine, as it might be that of some antediluvian monster which had been racing till it was scant of breath; and Slinkey knew that the train had slackened speed and was feeling its way forward slowly and cautiously. What could be the matter? What could have happened? By whom and with what intent had fog-signals been placed on the line on a night so clear and beautiful?

Such were a few of the queries that flitted through Slinkey's puzzled brain. And now not even the faintest pulsing of the engine could be heard. Could it be possible that treachery was at work, and that the driver had been warned and the train brought to a stand? Slinkey ran lightly down the steps and, kneeling, laid an ear once more to the rails. Not a sound came to him; the train and those in charge of it might have vanished into space, so unbroken was the silence. He got on his feet again, his tongue and throat as dry and constricted as those of a man who had been athirst for days. Instinctively his eyes turned to the tree to which the captured signalman had been bound; but he was too far away to be able to discern whether the man was still there. With a heart that misgave him, he hurried up to the tree, only to find that the prisoner had escaped. The cords were there, but the man was gone. Evidently, treachery was at work somewhere. Would not the wisest thing he could do be to decamp while he had a chance of doing so? He was asking himself this question but had not answered it, when up came Crofton, Lardy Bill, and one of the other men, at double-quick time. They, too, had heard the fog-signals, and had been as much at a loss to account for them as Slinkey had been. But when the latter told them that by some mysterious means their prisoner had contrived to escape, it was evident both to Crofton and Lardy that their carefully planned scheme had met with some dire mishap. They had been betrayed, but by whom? A traitor had been at work, but who was he? Each of them stared suspiciously at his fellows.

'If I only knew who it was that had sold us,' said Lardy Bill with a fierce imprecation, 'I'd scatter his brains with a bullet, though I had to swing for it after!'

'That's all very well,' said Crofton; 'but the question is, what are we to do now?'

'Do!' exclaimed Lardy, whom danger always made reckless. 'Why, do what we intended from the first. The train's waiting there, ain't it, not five hundred yards away? Instead of its coming to us, we must go to it—that's all. Is there any one here,' he demanded fiercely, 'who would rather not go?'

Slinkey would fain have answered that he for one would very much prefer to keep in the background, only that Lardy Bill was a man of whom he stood in mortal fear.

'Now, mates, come along,' added Bill. 'We are only fooling away our time standing here. One bold stroke and the prize is ours.'

Scarcely had the last word passed his lips, when some half-dozen dark-coated figures burst suddenly

through the hedge and made a dash into the midst of the gang.

'We are sold!' screamed Crofton with an oath. 'Every man for himself;' and with that he fired his revolver at the nearest of his assailants and then turned to flee. But he was too late. He was tripped up, seized, and handcuffed all in a breath as it seemed. A like fate befell Slinkey and the other man; but Lardy Bill, slippery as an eel, after felling two of his assailants, vanished in the darkness. The remaining two men, who had been left behind when Crofton and the others hurried to the signal-box, also contrived to escape.

Crofton's shot had taken effect. The man he fired at staggered forward a pace or two and then fell on one knee. Now that the scrimmage was over, his companions had time to attend to him. They helped him to his feet; he was evidently suffering great pain, but was perfectly cool and collected. As the light of the bull's-eye which one of the men produced fell upon his face, Crofton, who was close at hand, staggered back with a cry of amazement. Next moment he had recovered himself. 'I denounce this man as Gerald Brooke,' he exclaimed, 'the murderer of Baron von Rosenberg, for whose capture a reward of three hundred pounds is offered.'

(To be concluded next month.)

THE PLANET JUPITER.

ON the evening of the 7th of August last our astronomers were on the alert, and many telescopes were focussed on the planet Jupiter, which was about then to disappear from view behind the edge of the advancing moon. More than two thousand years before, on the 18th of the Egyptian month Epiphi, a watcher near Alexandria saw the same planet eclipse a well-known star in the constellation of the Crab. Such are the ages measurable by man, and measured by the marks on the calendar of the heavens—measured, too, so accurately that we can confidently say this ancient astronomer must have risen on that long-past morning not later than six o'clock. Many travel to his historic land to gaze upon its monuments, pathetic with the workmanship of long-vanished hands. They try to realise how these must have looked as the pomp of Egypt's kings defiled beneath them, and with difficulty they in fancy erect the shattered statue and build the broken temple. And we have all sympathy with their feelings. But yet we need only raise our eyes to the southern window to see the planet which the Pharaohs watched, and to see it unchanged.

From sunset until about six o'clock in the beginning of December, this bright orb may be seen hanging low in the south-western sky. It is easily distinguished by the steadiness and brilliancy of its light, and, as our ancient observer well knew, is worthy of our close attention. Among the wanderers of the sky it holds a principal place, sometimes surpassed in lustre by the fitful and changing Venus, but more usually the brightest orb in the heavens, and worthy of its name. These old astronomers burned with desire to penetrate the secrets of the midnight sky, and sometimes they succeeded. Yet two thousand years of effort and discovery have not availed to reveal completely the mystery hidden

in that brilliant star. It was an enigma to that ancient watcher, and it is an enigma to us.

What, then, is our advantage in ages of study? Much! For, if still an enigma, the enigma is a larger and grander one. The issues of its solution are fraught with power over every department of human knowledge and activity—over the most serious and sacred of religious hopes, as well as over the smaller matters of comfort in which science ministers to us. In that brilliant planet we see a workshop where a world is being fashioned out of substance like that of our own earth. From its study we may at any time rise rewarded with some secret of our world which we cannot learn from our globe itself, whose very nearness prevents our search. Its moons, first discovered by Galileo, helped men to see how the earth could roll on its orbit around the sun, and furnished no small strength to the arguments by which at last men were convinced that the earth was not the centre of the universe, and *this* idea where it has prevailed has already changed the whole current of human thought. In that bright point of light there is much hidden. In it much has been found well worth our attention for a short time.

For example, even a cursory look at Jupiter through a good opera-glass will show us that it is not a mere point of light, but has a distinctly circular disc. And if the time be favourable, the same handy instrument will show several minute stars close by—the famous moons of Galileo. To a very powerful instrument the planet shows a broad disc, like a dinner-plate two or three yards from the eye, covered with streaks and spots. These range in depth from white to very dark gray, and in colour show shades principally yellow, brown, and reddish. They form a brilliant and beautiful sight, once seen never to be forgotten. The spectator will not fail to notice the great brilliancy of the planet's light. Indeed, this strikes an observer of any celestial body at first very forcibly. The planets, especially Jupiter, viewed in a powerful telescope, do not seem so much to be illuminated as to *shine*. The light and shade of their surfaces are not like that we are accustomed to see; they seem formed of pure light. Jupiter especially looks like a world without shadow, in which the markings are simply various lights, coloured with exquisite delicacy.

So soon as telescopes sufficiently powerful to show it well were constructed, this marvellous brilliancy attracted attention. In a good instrument Jupiter almost dazzles the eye, and fills the whole field of view with a bright glare. If the telescope be moved so that the planet is just out of sight at one side, this glare is still seen; and if the planet be gradually brought into view, the bright illumination which precedes it produces an effect akin to sunrise. Most stars disappear in his presence, as they do before the sun's approach. We can hardly doubt that reflected sunlight alone does not account for this great brightness, especially when we remember that, at Jupiter's distance, sunlight has less than one-twentieth of its power with us.

This impression is strengthened by the extent of the planet's influence on a photographic plate. Professor Bond, of Cambridge, United States, on testing this found a remarkable result. He

compared the surface of Jupiter with that of the moon, and found that the former had fourteen times more photographic power than the latter. The moon's surface, too, has several advantages in this comparison. It is of great reflective power, and is covered with no atmosphere to absorb its rays, yet if removed to Jupiter's distance, it would only have one-fourteenth of his photographic power. This fact has made it more easy to take the planet's picture. In a copy of this, which lies before the writer, the principal markings are well shown, although the planet is depicted as only about the size of a large pea. This fine picture we owe to the splendid telescope constructed by Mr A. A. Common, of Ealing, near London. It is three feet in aperture, and concentrated such intensity of light on the sensitive plate fixed in its focus that the planet's picture was taken in a second and a half.

Whence comes, then, this intensity of the planet's light, most marked in photography, where it is most liable to be weakened by reflection? If not wholly reflected sunlight, what is it? The answer to this question was long dubious, but may now be given with tolerable certainty. Jupiter shines by *his own light*, as well as by reflected solar rays, and is so far akin to the sun and stars. And there can be little doubt that he so shines because he is intensely hot. Some bodies shine although they are not very hot, such as putrid fish, phosphorus, and the various luminous insects. Comets, too, and some nebulae shine partly by intrinsic brightness which is developed at a very low temperature. But there is a *solidity* and *yellowness* about Jupiter's light which catch the eye at once, and irresistibly suggest that he is hot even to incandescence.

Some parts of his surface are very brilliant, others more dark, and to shine as he does *on the whole*, the bright parts must be brighter than any reflecting surface known to us, except a polished mirror.

The comparative lightness of the planet also favours this theory of its high temperature. Taken as a whole, it is more than three hundred times as heavy as the earth; but if we could obtain a small piece of its substance and compare it with a similar piece of our own rocks, we should find it only one-fifth as heavy. Now, this means a great deal. It shows that any part of Jupiter's interior mass is under an enormous pressure. An enormous quantity of stuff presses down upon it, and is pressed down by an enormous force. The gravity of the planet's mass presses it thus together with a force two and a half times greater than any so exerted on the substance of our world. Yet, instead of being squeezed into a substance far denser than our rocks, it remains only one-fifth as solid as they are. There is only one agent which we know powerful enough to maintain it in this condition, and that is intense heat. If hot, Jupiter's substance will resist pressure as steam does, and remain vaporous and liquid under an enormous weight. It is probable, in fact, that a great portion of his mass consists of vaporous clouds, suspended above a surface glowing with heat, so as to mingle in its ebullition even with the vapours above it, and by its explosions to drive them hither and thither as in volcanic eruptions.

A minute examination of Jupiter's visible sur-

face confirms this. Our readers will remember his famous belts, girdling his surface on either side of his equator. These are, of course, the most marked features of the planet, and in feeble instruments they are to all appearance wonderfully steady and permanent. Cassini, a great early observer, using comparatively feeble telescopic power, said that he had watched them for forty years without seeing a change. There can be little doubt that *in position* at least they are permanent, for they have been measured microscopically by M. Arago in 1811, by Mr Russell of Sydney in 1876, and by the writer in 1881, with results substantially accordant. Yet, though thus steady in position, they vary much in distinctness, and are broken up by spots and markings which change with amazing rapidity. For example, on the 28th of October 1880 Mr Russell noticed two black spots on one of the belts. *Next night* they were *three* in number, and the belt was very much enlarged; a change indicating, as he observes, the action of a tremendous force, as in a few days the belt had increased in breadth from six or seven hundred miles to two thousand, and that for a part of its length extending one hundred and twenty thousand miles. In a few days after this the whole belt looked as if broken up into cumulus clouds and irregular masses of vapour. Changes such as these are indeed very common. On another occasion Mr Russell observed a large cloud of a blue colour, which he was certain was not visible a few days before, and which disappeared again in three days; showing that some very great atmospheric change had occurred in a comparatively short time.

Sometimes, however, brown, blue, or white spots appear on the planet, and last for weeks or months. These afford opportunity for determining its period of rotation, and have given the most astonishing variety of results. In fact, there is no doubt that different parts of the planet's surface revolve at different speeds; so that, if solid and inhabited, people would have time-measures of a most confusing kind, the day (corresponding to ours of twenty-four hours) being longer or shorter according to their place in latitude. Our readers may have heard of the strange phenomena presented by the famous Red and White spots during the winter of 1883-84. The great red spot appeared on the planet's southern hemisphere, and the white spot near the equator. They ran a kind of race round the giant globe, the white spot gaining on the other one at the rate of no fewer than two hundred and sixty miles per hour. So that, supposing the red spot fixed in its position, the white one must have been traversing the planet's surface at this enormous speed.

Now, just as we saw the small density of the planet demand a force to counteract the compressing power of its gravity, so these enormous and rapid movements require great energy to account for them. In both cases we can only think of heat as the power required. It is to the solar heat that our storms and hurricanes owe their origin and power of movement. But this at Jupiter is only one twenty-seventh of what it is with us, and would seem far too small to cause the enormous changes there taking place. We are therefore driven again by this series of facts to adopt the theory that Jupiter possesses vast stores of heat, which alike maintains his materials in the liquid

and vaporous condition favourable to rapid movement, and causes explosions and volcanic hurricanes amongst them which we can but feebly imagine.

No doubt our readers will ere this have noticed that this theory supposes our planet to be not unlike the sun, only on a smaller and less vigorous scale of size and disturbance. This idea was much strengthened when it was found that the features of Jupiter's surface had a rhythmical period of change coincident with that of the solar spots.

Yet we are confronted with observations of a different kind which seem to raise insuperable difficulties, and show at least that the enigma of the planet is not yet solved.

The spectrum of Jupiter shows the rays due to reflected sunlight, and actually some bands of *absorption* besides, so that its testimony is against the theory of great heat in the planet's atmosphere. There is strong absorption of light in the dusky belts, indicating the greater depth to which sunlight penetrates at those portions of the planet's surface. The permanence of *position* maintained by the belts, in spite of their change in depth and shape, is also an unfavourable fact. This seems to point to some steadily maintained character of the surface inconsistent with mere fluidity. The great red spot, too, of which we have already spoken maintained its place so long (for many years) as to suggest some stable condition of the part of the planet beneath it. It would almost seem that the real state of the planet is a semi-solid one, and that a hot crust has formed at its surface over a liquid and gaseous interior; this crust, however, not being strong enough to prevent constant outbursts of gas and vapour in a highly heated state, which produce tremendous and sudden changes in the planet's vast atmosphere. Time and patience may confirm this theory; at least they cannot fail to let us farther and deeper into the secrets of a planet which is evidently one of Nature's most interesting workshops.

A LEGAL SECRET.

CHAP. V.—CONCLUSION.

WHY does Mr Pilkington sit so late in his library, after his guests are gone, with his armchair drawn up to the fireless grate? It is nearly daybreak, and there he is still seated, his head leaning against his hand, pondering deeply. His face expresses a startling change. It has become more wrinkled and withered than one would have supposed possible, in a few hours' time, even in so old a man. Does anything unusual vex his mind? That would seem improbable. For has he not confided all the legal secrets to Sidney—all that he need confide? On the morrow, another Trench will take the senior partner's chair in the oblong room; for another Pilkington has played out his legal part, and has taken leave once and for all of his clients. Lincoln's Inn has seen him for the last time.

Is it this fact that troubles him? No; Mr Pilkington puts every trust in Sidney Trench. He would not otherwise have taken this decisive step. The load has been lifted off his mind. The load of other people's troubles? Yes; and yet something is vexing him. His face grows

more anxious every moment; he looks frequently towards the door; but at last he leans back wearily in his chair.

And now a shadow begins to gather over his face. What shadow? The lamp burns steadily upon the table close beside him. What lamp could be the cause of a shadow like that? Mr Pilkington is distinctly conscious of its presence, and smiles grimly. Is it the shadow that, sooner or later, hovers over all?

Presently the door is opened, and Mrs Pilkington steps swiftly towards the chair and kneels down beside the old lawyer and presses his hand lovingly in both her own. 'You shall never see me sad now,' she tells him—'though there are bright tears glistening in her eyes—for I shall now have you with me always—all day long; and,' she adds in a more subdued voice, 'dear Rosa too.'

Mr Pilkington's troubled look increases. 'Sidney has told you.—You have seen her, then?'

The wife, still bending at her husband's feet, touches his hand with her lips. 'How good you have been! The news has been broken to her so tenderly and to me too.—And is it not marvellous? She has forgotten nothing.'

The lawyer's expression becomes startled. 'Nothing?'

Mrs Pilkington looks inquiringly into his face.

'She has not told you,' he says doubtfully, 'how she disappeared?'

'No.'

'Then I must. The man who is alone to blame,' says he in a broken voice—'who has kept her from you for twelve long years—is your husband!'

Rising slowly from her kneeling posture and standing before the old man, Mrs Pilkington's face expresses blank amazement: 'You!'

It is obvious from her tone, her whole attitude, that she is utterly dumfounded at the lawyer's words. How can she, who has never doubted his integrity, credit this avowal? She has heard on more than one occasion the tradition concerning the house of Trench, Pilkington, and Trench. It flashes across her now. She has heard it affirmed that as soon as the senior has imparted the legal secrets to his successor, his brain begins to show signs of decay. Can such a fatality have already overtaken Mr Pilkington? It would scarcely seem possible. And yet she would prefer to believe his intellect impaired than accept such an admission from him as truth.

The lawyer waves his hand impatiently towards a chair. 'Sit down beside me,' says he in a tone of quiet authority, 'and listen to what I have to tell. It is a painful affair; it is the secret that I have bidden—the secret you would have had me keep from you; but I cannot. No partner in our house, I feel very confident, ever carried a secret to his grave. It would have destroyed our reputation. Even our secrets are not our own.'

She sits down without uttering a word. Her husband's firm manner, his distinct though somewhat feeble utterance, is that of a man who obviously retained his mental vigour. She is overwhelmed with grief; and although she tries to keep back her tears, she looks at him through a mist, and the shadow which is gathering over his face escapes her.

'It was your wish,' says Mr Pilkington, 'to spare me the pain of this humiliating task—the pain of confession. Do you think I do not fully appreciate your trustfulness? Indeed, I do. But it has not altered my purpose; it has given me strength to speak.' For a moment he pauses with a still deeper look of thought on his face. 'It was jealousy—a mad jealousy that began it. That was the root of all this trouble. How can I have been so irrational, so unjust? But so it was. What I ought to have admired, I detested. Your passionate love for your child drove me to desperation. It roused the demon in me. I was determined that nothing, not even your affection for little Rosa, should come between us.—Not that in reality,' he hastened to add, 'it ever lessened your love for me. But I imagined it did: it was more than I could endure.' The lawyer's voice grows weaker and more troubled as he proceeds. 'That she was your child, though not mine, should have awakened my deepest sympathy. But it had the opposite effect: I could scarcely hide my aversion. I hated to see you caress her; I even hated at last to hear you speak of the child. No other subject—so it seemed in my madness—interested you: I was even mad enough to believe that you had no love for any one except this child—none even for me.'

'Did I deserve this?'

'You deserved a better husband; for an evil thought seized me at last,' says the lawyer, 'and I could not resist the temptation.—You have not forgotten that journey? I took your child—I took Rosa with me.'

'Forgotten?' murmurs Mrs Pilkington, clasping her hands.

'I took her with me for one object—to remove her out of your sight and mine.—And you, dear wife, never questioned my story. You believed all that I told you; you believed that Rosa was lost.' Mr Pilkington's voice grows very weak now; but his words are still articulate and full of meaning, though slowly uttered. 'It was only then, when too late, that I realised what a fatal error I had made. Your love for me never changed: it became no greater, no less. It was the same true devotion that it always had been: it was expressed in your actions more than in your words—the truest love of all.—Ah, my sweet wife! how could I now feel that I merited the love you gave me? I saw you silently mourning the loss: never a word of complaint escaped you. How I longed to restore to you your child! And not many months went by before I again took a journey to St Albans in search of her, with the express intention of bringing her home. But she was gone, no one knew where. A packet of letters from Abel Norris, written from St Albans, was all I had. I kept them locked in your deed-box at Lincoln's Inn. I never had the courage, until Sidney discovered the old clerk, to give this packet to you. You burnt the letters without suspecting my treachery, and I could not speak—I could not break the news to you then that Rosa was found. But now you know all.'

The shadow lies darkly upon Mr Pilkington's face; but he seems to heed it no longer. The grim smile never recurs; the expression has become stern and stony, like the faces of the

sphinxes which are staring at each other over the gateway out in the summer dawn. There sits the old lawyer, motionless, as though overcome by sleep. Mrs Pilkington raises her eyes slowly; the look is full of unchanging love and free forgiveness. Does he see that true woman's glance? No word escapes his lips; his countenance is as stern and stony as ever, and yet a tear rests upon his cheek!

And now a look of terror comes into Mrs Pilkington's face, and she utters a piercing cry. Still the old lawyer sits motionless in his chair; still no word escapes him. His secrets are all told at last.

Sidney's first year as senior partner, a year that went quickly by, placed a visible line of care upon his young brow. There never had been known, in the recollection of the oldest clerk, such legal receptions as Mr Trench held in the oblong room. Other waiting-rooms besides the octagonal chamber had to be set apart for those who had made appointments. It was as though clients had purposely reserved their secrets for Sidney's ear, from a dread of the able old lawyer—a dread he could well comprehend from personal experience in early days.

One afternoon, when the trees in New Square and Lincoln's Inn were again in leaf, Sidney walked over to Took's Court. There sat Abel Norris, at his desk in the dingy parlour, copying documents with the same diligence which he had shown when first employed by the great legal firm. Nothing was changed. The black cat, his only companion now, lay curled up on the hearth-rug like a great blotch of ink—the only one in the room for which the old clerk was not responsible.

'Well, Norris, when are you coming to pay us a visit at the villa? Rosa asks me the question every day.'

Norris shook his head. 'Rosa—Miss Gage, I should say—is very good to think of me, sir. She has a kind heart; she'll never forget me, I know. Will you tell her, sir, that she is always in my thoughts? I miss her dreadfully sometimes. It ain't to be wondered at. Is it, Mr Trench? Twelve years was a long time. It was like losing one's own daughter, when Mr Pilkington took her from me.' There were tears in the old clerk's eyes.

'Then why not give up Took's Court?' said Sidney. 'You would find gardening a more healthy occupation. Why not give up the law? I wish I could,' the young lawyer added, laughingly. 'If some one would offer me a pension, I would retire without loss of time. What *can* you find in these old parchments?—and he pointed to the clerk's desk—'to keep you in town?'

'It's habit, Mr Trench,' said Norris, taking up his pen. 'It's too late now to change this for a rake or spade. Nor would an idle country-life suit me, sir, after more than fifty years of desk-work. This home is all I need, sir, for the short time I've still to live.'

Such was always the answer, which Sidney received whenever he spoke to Norris about himself. No argument would induce him to forsake the precincts of Chancery Lane. The inky parlour had a fascination for him; neither the green fields nor the prospect of being near

Rosa would tempt him to leave his old desk even for a single day.

Returning home that summer evening towards sunset, Sidney went through the grounds in search of Rosa. He walked along deep in thought. He had seen so little of her during the last twelve months; he had been overwhelmed with work, which had frequently kept him very late into the night at Lincoln's Inn. And Rosa was occupied too: her education had been all but entirely neglected; and no one had been more quick to realise the need of making up for lost time—for twelve years of comparative idleness. Her mother superintended her studies; and Rosa had made such rapid progress that Mrs Pilkington had good reason to be proud of her daughter's talent as well as her beauty. Sidney had indeed found for her a loving companion. Was it surprising that she and Rosa were seldom out of each other's sight?

Thinking of these things—while still searching in the grounds for Rosa—all that Mr Pilkington had told him crossed Sidney's mind. He had told him about the black deed-box marked 'Rosamond Gage,' which had stood in the octagonal room many years. For it belonged to a beautiful client, little more than twenty years of age, who had one day paid a professional visit to Mr Pilkington. It was a prolonged interview, that first one; for Rosamond Gage had a lengthy secret to confide. She had married when eighteen years of age; and after two years—years of domestic trouble and ill-treatment—her husband, Captain Gage, had left her. She possessed, however, a great deal of property; and through Mr Pilkington's legal assistance, most of it had been saved. Her gratitude towards the lawyer was unbounded; and when, some four or five years afterwards, news reached her of Captain Gage's death, she became Mr Pilkington's wife. She had brought to her new home her little daughter, Rosa, then barely six years of age.

Sidney now entered the grove where he and Rosa had met upon the evening of her return to her old home. They had not met here since. But to-day an irresistible impulse to speak with her had seized him. Glancing around, as he entered the pathway, he caught sight of Mrs Pilkington. She left the bench where she was seated and came towards him.

'Where is Rosa?' were almost his first words.

Mrs Pilkington gave him a bright glance. 'She went to meet you, Sidney, a moment ago. Are you not all in all to her?'

Sidney's face grew serious. 'I may speak to her now; may I not?'

'Dear Sidney, there is no need to ask me that,' said Mrs Pilkington tenderly; 'my one thought is for her happiness and yours.'

Rosa now coming in sight among the trees, Sidney went towards her with a quick step. 'Wouldn't dad come and see me?' said the girl with something of her old peevish way. 'You promised to bring him, Sidney, this afternoon. How unkind!'

'It is useless, Rosa,' was Sidney's reply. 'He prefers ink and parchment to sunshine and green leaves.' And he told Rosa all that Abel Norris had said. 'You must go and talk to him yourself,' he added. 'But I fear nothing—not even your voice—will move him.'

The year that had passed—a year in which so much care and cultivation had been bestowed upon her—had wrought a change in Rosa. She seemed taller, more dignified, more sedate. The wild dark eyes had lost none of their brightness, but they were kept under more control; the black lashes drooped more frequently now when Sidney was by.

'Rosa,' said he as they walked along side by side among the trees, 'do you remember asking me, a whole year ago, if well-bred people came here to suppress their sentiments?'

'Ah, what a long year,' said Rosa evasively, 'it has seemed to me!'

Sidney persisted: 'Do you remember?'

The whisper came from Rosa's lips: 'Yes.'

'And my answer to your question was,' Sidney continued, 'that I came here to indulge the wildest dreams. Shall I tell you what they were?'

A flash of the dark eyes was Rosa's only answer.

'My dreams were mostly,' said Sidney, 'about my boyhood: my dreams were mostly about a little girl who played with me in a shady wood on summer evenings such as this. I called her—I still call her so in thought—my little sweetheart. Her real name was Rosamond Gage.'

Still no word came from Rosa; but she drew her breath more quickly, and a number of little sighs escaped her. The lashes were quivering too, but they were stubbornly cast down.

'It was a child's romance,' Sidney resumed—'a romance that is seldom finished as children would have it end in after-years. I wonder how this one will end? Rosa, are you still my sweetheart? Will you be my wife?'

There was still no answer; but Sidney felt a little hand sliding softly into his own. He pressed it gently; and so these two old lovers—still very young in years—walked on in silence through the wood as they had done in bygone days.

DISGUISED AUTHORS.

No precise reason can be given for authors writing under fictitious names. It is probable that many who adopt a *nom de plume* have some object for so doing peculiar to their state of mind at the moment of sending their first book into the world. Not many authors are very sanguine as to the success of their first work; they are apt to believe that even though the publisher has accepted it, public critics or friends may not be quite enthusiastic as to its merits. It is, therefore, often thought better by the author to publish the book anonymously under a feigned name, for it is easy and delightful afterwards to confess to being the author of the book when everybody is talking its praises, should it prove a hit. It is by no means unfrequent for an author to use a fictitious name to prevent his or her whereabouts being discovered, when it is desirable to keep the same unknown. Most people, in spite of that oft-quoted adage of Shakespeare's, have a great depth of belief in a name, and always consider themselves sufficiently ingenious to fabricate a more striking and easily remembered name than that given them by their godfathers and godmothers. In some cases this is correct enough; but as often as not totally unnecessary.

It is worth noting how very usual it is for writers to hide themselves under some pen-name when attempting for the first time a style or subject out of their ordinary line, such as Scott did when he quitted poetry and took to his prose romances. If a poet writes prose, he frequently disguises the authorship; and it is a very common occurrence for a prose writer who bursts out in a volume of verse, to sign some feigned name. But in spite of all that may be conjectured on the subject of the reasons why fictitious names are used, there are cases where no suggestion can be made as to motive. Why are some excellent writings merely signed by a single letter of the alphabet? How is it that there are books, essays, poems, all sorts of writings, of very great merit, without any name or initial, the author being as unknown and dead to the public as are those who sleep in quiet but beautiful corners of our churchyards, with nothing but an evergreen mound to mark that some one rests beneath. Happily, the names of the authors of many unsigned great books have crept out. *Friends in Council* and *Vestiges of Creation* originally appeared without an author's name, but the writers of both are now well known.

Fictitious names in fiction are by no means confined to the pages of the stories, for authors of this kind of literature seem very fond of giving a made-up name in place of their own. Most people know that 'Edna Lyall' stands for Miss Ada Ellen Bayley; 'John Strange Winter' for Mrs H. E. V. Stannard; 'Artemus Ward' for Charles Browne; 'George Elliot' for Marian Evans; and 'Cuthbert Bede' for the Rev. Ed. Bradley. Does every one know that 'Rita' is the *nom de plume* of Mrs Otton Von Booth; 'Ouida' of Madame Louise de la Ramé; 'Max Adeler' of Chas. H. Clark; 'Josh Billings' of H. W. Shaw; 'Sam Slick' of the Hon. T. C. Haliburton; 'Marie Gaston' of Alphonse Daudet; 'Holme Lee' of Miss Harriet Parr; and 'Sarah Tytler' of Miss Henrietta Keddie? Everybody knows that 'A. L. O. E.' stands for 'A Lady of England'; but some may not be aware that this lady is a Miss Charlotte M. Tucker.

Here are a few more of the names which occur most frequently in one's reading: 'Hans Breitmann' stands for Charles Godfrey Leland; 'Country Parson' and 'A. K. H. B.' Rev. Dr Boyd, St Andrews; 'Christopher Crayon,' J. Ewing Ritchie; 'Bab,' W. S. Gilbert; 'Edward Garrett,' Isabella Fyvie Mayo; 'Girl of the Period,' Mrs Lynn Linton; 'Marian Harland,' Mrs Terhune; 'H. H.,' the late Helen Hunt Jackson, whose romance *Ramona* has done for the American Indians what Mrs Stowe has done for the slaves; 'Professor Hoffmann,' Angelo J. Lewis; 'Ascott R. Hope,' Robert Hope Moncrieff; 'Henry Irving,' J. H. Brodribb; 'Johnny Ludlow,' the late Mrs Henry Wood; 'Helen Mathers,' Mrs Reeve; 'L. T. Meade,' Mrs Toulmin Smith; 'Owen Meredith,' Lord E. R. Bulwer-Lytton; 'Joaquin Miller,' C. H. Miller; 'New Writer,' Lewis Morris; 'Cornelius O'Dowd,' Charles Lever; 'O. K.,' Olga Kireet, now Madame Novikoff; 'Pen Oliver,' Sir Henry Thomson; 'Oliver Optic,' W. T. Adams; 'Max O'Rell,' Paul Blouet; 'H. A. Page,' Alexander H. Japp; 'Pansy,' Mrs S. M. Alden; 'Phiz,' Hablot K. Browne; 'Rob Roy,' John

Macgregor; 'S. G. O.,' the late Rev. Lord Sydney Godolphin Osborne; 'Hesba Stretton,' Sarah Smith; 'Annie Thomas,' Mrs Cudlip; 'Toby, M.P.,' Henry Lucy; 'Mark Twain,' Samuel L. Clemens; 'Uncle Remus,' Joel Chandler Harris; 'Verax,' Henry Dunckley; 'Elizabeth Wetherell,' Susan Warner.

When that excellent story *Vice Versa* appeared, it was suspected in literary corners that the name F. Anstey was a fictitious one. A similar conjecture was made respecting the names Hugh Conway and H. Rider Haggard. However, the latter is quite correct, whilst F. Anstey is part of the name of F. Anstey Guthrie; but 'Hugh Conway' proved to be a name assumed by the late F. J. Fergus.

Most of our poets, both great and small, have at some time appeared under the disguise of a *nom de plume*; but the list of those who make a regular practice of doing this is a short one; Lady Wilde, a Society poetess, is known to be the authoress of poems signed 'Speranza.' 'Mary Berwick' stands for Adelaide Anne Procter, and 'Barry Cornwall' for Bryan Waller Procter. One would hardly have credited Longfellow with having signed himself 'Joshua Coffin.'

There are many cases on record of women adopting a man's name, for the sake, no doubt, of giving their works extra weight. George Eliot, Currer, Ellis, and Acton Bell (the Brontë sisters), and Georges Sand are fitting illustrations.

To works of a practical and instructive nature authors usually sign their real names, but there are exceptions. 'Cavendish' (on Whist) is the *nom de plume* of Henry Jones; *The Battle of Dorking* is by Colonel Chesney; and *Religion and her Name*, by Archbishop Whately, and not by a 'John Search.' 'J. Arbuthnot Wilson' stands for Mr Grant Allen; and 'Stonehenge' (on Dogs) for the late J. Walsh. Thomas Carlyle wrote of himself in *Sartor Resartus* as 'Herr Teufelsdröckh'; and Charles H. Ross sketched himself in the character of 'Ally Sloper.' Mrs Valentine delights our babies as 'Aunt Louisa'; William Combe related the tours of 'Dr Syntax'; and Joachim Heinrich Kampe has interested everybody with the remarkable adventures of the *Swiss Family Robinson*.

THE MONTH:

SCIENCE AND ARTS.

A DOCTOR of medicine dating from Texas writes to an American journal concerning remedies for snake-bite. He says that he has tried as antidotes a number of different agents, including whisky, bicarbonate of soda, ammonia, &c., with negative results; but that he has found two antidotes, which if used in time seem invariably to prove effective. These remedies are permanganate of potash and chloroform. The former of these, we may remind our readers, is familiar enough in solution under the name of Condy's Fluid. For snake-bite it is administered in one or two grain doses by the hypodermic syringe; and the chloroform is used both locally and by inhalation. We trust that the efficacy of these remedies has not been exaggerated, for when we remember the

frightful mortality in India alone from snake-bite—the reported cases numbering some thousands annually, and the unreported cases probably numbering as many more—we must acknowledge that the subject is one of supreme importance.

So many apparently well-authenticated cases concerning the water-finding wonders of the divining rod have been recorded, that many persons are induced to believe that there must be something of a miraculous nature connected with it, or at least that those who use it are possessed of a special and mysterious power. One of these water-finders has just been subjected to experiment by a shrewd observer in the person of Professor Ray-Lankester, who has told the story in a letter which has lately been published. This magician of the divining rod—a mere youth—had been exhibiting his powers at a certain place in the north of England where the Professor and a medical friend happened to be staying. The water-finder went through his performance in the usual way—that is to say he held a hazel twig in his hands, and at certain points, as he walked over the land, this twig by some means was urged downward, and when this occurred, he declared that there was running-water beneath his feet. The places so indicated were at once marked by this doubting Professor and his friend. The water-finder was then blindfolded, turned round three or four times, so that he might be confused as to his locality, and he was then marched over the same ground again; but in no case did the hazel rod make any movement when the marked places were reached. In the second excursion he did find several new spots where he declared water to be, perhaps in the hope of hitting once more upon the original marked places. Confidence in his powers was further shaken by noting that when he was taken along a courtyard under which there ran a conduit through which water was known to be flowing at the time, the hazel rod gave no sign whatever. We may therefore feel convinced that whatever may be the pretensions of other holders of the divining rod, in this case at least it was proved to be an imposture.

The *Electrical Review* points out that although the modern man-of-war is not the thing of beauty which was presented by its prototype, it has one advantage at least not possessed by 'the wooden walls of old England.' This advantage is found in the very few occasions which are recorded upon which the ironclad ships have been struck by lightning. It cannot be said that the modern vessels are actually exempt from injury by lightning, but they are so far protected by their construction, and the materials used in that construction, that, when struck, the results are trivial, and have often in fact been ascribed to the mischievous action of some one on board the vessel. In the old days it was very different; during a period of fifty years, two hundred ships of our navy were struck by lightning, and in one case five vessels were struck during a single night, the number of fatalities resulting therefrom being considerable.

The late Exhibition of the Photographic Society

of Great Britain in London was successful in every way; a larger number of visitors passed through the galleries than have before been recorded, and the works exhibited were in excellence decidedly above the average. The various new processes and modifications of existing processes which have come forward during recent years—some only within the last twelve months—were well represented here; and a noticeable feature was the large number of pictures shown not printed by the aid of silver salts. The more permanent platinum has to a great extent usurped the place of silver, and the results achieved are not only permanent but far more artistic. We may also notice in this connection the series of one-man exhibitions which have been held during the past year at the Camera Club in London. The last of these, which has just closed, consisted of the works of one of the best known photographers, Mr H. P. Robinson of Tunbridge Wells.

A simple plan of dealing with sewer gas was proposed by Mr John Penn of Greenwich some years back, and he has lately, in a letter to the *Times*, called renewed attention to the subject. His method consists in causing ordinary street lamps to be made air-tight, except an opening below leading into the sewer or drain, and a chimney above to carry off the products of combustion. Experiments with a lamp so arranged showed by the discoloration of test papers below the burner that sewer gas was actually passing through the lamp, and by freedom from discoloration of similar paper placed in the chimney that the gas had been burnt, and had been rendered innocuous. Mr Penn believes that if standard lamps were arranged along the course of drains and sewers in our towns, the pressure would be so greatly reduced in these subterranean water-ways that sewer gas would no longer be forced into our houses. The system has the merit of being cheap, and is certainly worthy of careful trial.

The liquidator of the unfortunate Panama Canal Company has endeavoured to raise the hopes of the bondholders by a statement relating to their future prospects. He tells them that he has appointed an inquiry Commission of unimpeachable honesty, consisting of French, English, Dutch, and Belgian experts, five of whom will proceed to Panama in December—the dry season—in order to make a thorough examination of the works and to report upon the same. He then hopes to find a company to take over the plant and complete the Canal, and if sufficient capital is not forthcoming in France itself, it will be sought elsewhere.

Mr George Wicks, of Ayton, has invented a new form of domestic window-sash, which is so fixed in its frame, that while capable of the usual vertical sliding movement, it can be turned round bodily, so that the outer glass can be readily cleaned. This can be done while the cleaner stands in safety within the apartment to which the sash is fitted. This 'Safety Window' seems to meet a real want, and as it does not involve any considerable additional cost, it is likely to meet with extensive adoption.

It would seem almost a necessity of our civilisation that every innovation, whatever its merits may be, cannot come to the front without much bitter discussion between its promoters, and what we may call, in parliamentary language, 'the

opposition.' To take two subjects only which have been for some time agitating the public mind, we find the usual differences of opinion. We allude to the questions of Hydrophobia, and the treatment of that disease and others by the system which has grown out of the chemical researches of M. Pasteur. Those who can only afford time to take a passing glance at the numerous letters which have appeared on these two subjects in the public press are naturally disposed to ask which party can be right, while at the same time they feel a regret that there is no brief authoritative statement upon which they can rely for guidance. To persons situated thus we cannot do better than recommend a perusal of Sir Henry Roscoe's recent presidential address to the Birmingham and Midland Institute. We trust that in the public interest this address—a most admirable and instructive discourse on the Germ theory of disease—will be distributed in such form that it may be read by the million.

Mr J. L. Hamilton points in the *Lancet* to a fact that is not generally known—namely, that the custom of packing fish in ice for any length of time has the effect of spoiling it as an article of food. The reason of this is that the peculiar character of the skin of fish and the thickness of its flesh prevent the cold from ordinary ice being sufficient to freeze the internal parts, so that decomposition is not arrested except on the outer surface, or perhaps a little below it. The writer points out that, in the United Kingdom, fish is seldom caught on Saturday afternoons, and the nets also remain idle all Sunday, so that Friday's fish does not reach the metropolis until Monday morning. He says that 'much of the best prime trawl-caught fish sold at Billingsgate is from three to ten days old.' Every one knows that London fish is very different from fish freshly caught, and what Mr Hamilton has pointed out may enable us to understand the reason for it. Unfortunately, it is difficult to point out an efficient remedy.

The *Scientific American* publishes a new method of filling up the pores of wood with waterproofing material so that boxes made of it will hold liquids. The method is chiefly applicable for the construction of the outer cells of electric batteries, but of course can be turned to many other useful purposes. The wood or complete box is first of all thoroughly dried. It is next placed in a closed vessel, which is then exhausted of air by means of an air-pump. The protecting liquid is now introduced in sufficient quantity to cover the wood; and lastly, air is admitted, the pressure of the atmosphere driving the liquid into every pore, and so completing the process.

The immense business carried on by the Post-office department of this country is shown in a curious way by an alteration that has lately been made in the kind of string used for fastening up letter-bags, parcels, &c., while at the same time we learn the wisdom of economy in small things. The string hitherto used in the post-offices was made of hemp, and cost about twopence a pound. It is now replaced by jute, which costs about one-third of that sum. The alteration represents the saving of ten thousand pounds a year.

A particularly ingenious and useful piece of apparatus has been patented by Mr L. L. Wands, of New York. This is a pair of scales which is

fitted with two cone-shaped indicators, which can be set to show the value of any fraction of a given unit of weight, so that a purchaser in a shop can see before him not only the weight of the article which he is purchasing, but also its value in hard-cash at the stipulated price. This machine should be of great service to the poor and ignorant, who pay far more dearly for their necessities than those who are well to do. It is well known that in the purchase of their ounces of tea, sugar, &c., they are often shamefully robbed in quality, quantity, and price. The small shopkeeper who would be enterprising enough to introduce this check-scale system would soon add to his connection.

A new kind of type-writer has lately been exhibited in London under the name of Wier's Cryptograph. As implied by the title, this apparatus has been designed for the purpose of secret writing, the key to which is known only to the writer and his correspondent for whose personal letter it is intended. By using this machine the ordinary keys for the fingers can be made to answer to the letters or figures inscribed upon them, and thus produce a letter in normal language, or by a certain adjustment can be made to print a jumble of letters without apparent meaning. But there is meaning in them all the same, for when the recipient of the letter sets a corresponding machine to the same adjustment as that used by the original writer and proceeds to type-write it once more, order comes out of confusion, and the receiver gets the information intended for him. The number of ingenious cipher alphabets which have been devised is legion, but this is the first time that secret writing has been made possible by a machine in such common use as the type-writer.

The United States consul at Cognac has issued an interesting and instructive Report upon the brandy production in the large district of which Cognac is the commercial centre. The brandy produced is divided into two principal classes—namely, 'Champagne' brandy—from grapes grown on the plains—and 'Bois' brandy, the product of districts abounding in trees. This latter variety is subdivided into qualities having different names, according to the kind of soil upon which the grapes are grown. The entire crop of grapes is converted into wine, which is subsequently distilled into brandy, eight and a half gallons of wine being required to furnish one gallon of the spirit. The ravages of the phylloxera have been so formidable that the amount of brandy produced in the district of late years has become reduced to little more than a ninth of what it was before the year 1878, when the dreaded pest first made its appearance here. But sad to say, the shipments of brandy have decreased only one half, a fact which points too significantly at wholesale adulteration. The least objectionable method of sophistication is the addition of rectified spirit before the wine passes through the distillation process; but a more common way is to add coarse spirit from beets or potatoes to the freshly distilled brandy. It would seem on the whole that unless the phylloxera be stamped out, pure brandy will be a thing of the past.

During a recent meeting in Paris of the International Congress on Climatology, several interest-

ing papers were read and discussed. The Professor of the University of Mexico spoke in glowing terms of the highlands of that little-known country, and of their mineral waters and climate, which in the future would make them, with increased facilities for travelling, as popular as the health-resorts of Europe. Mr Adolph Smith gave it as his opinion that a far larger number of British patients and tourists would avail themselves of the glorious sunshine to be found in the south of France, were it not for the defective sanitation in many of the continental so-called health-resorts. He alluded to bad drainage of the houses, contaminated wells, and absence of efficient methods of disinfection of rooms occupied by fever patients. He quoted the English watering-places as being far better in all these respects, and called attention to the circumstance that in spite of the inferior English climate, the mortality only averaged fifteen per thousand; whereas in the southern French health-resorts it rose to twenty and even thirty in the thousand. Several delegates protested against these statements, and declared that all good precautions were taken in their respective towns. It would seem, therefore, that the places which most required attention were not represented at the Congress.

A new form of ship's lamp has been introduced by Messrs Ridsdale & Co., of 54 Minories, London, by which a far more penetrating light can be obtained than from the regulation lamps now in use. The lamps are intended to replace the ordinary red and green (port and starboard) lights used on all vessels, and their principal feature is the substitution of a hollow lens filled with coloured glycerine for the solid glass 'bull's-eye' formerly employed. Photometric tests show that the increase of light is very great, and we are glad to learn that the new lamp is to have searching tests by the Trinity House authorities.

A German paper describes a soft alloy which adheres with such tenacity to glass, china, metal, and other smooth surfaces that it can be used as a solder. It consists of finely divided copper, obtained by agitating a solution of copper with granulated zinc, when the latter metal is precipitated in the form of fine powder. This is mixed in an iron mortar with sulphuric acid of definite strength, and to the paste thus made is added mercury. The mixture is washed to remove the acid, put aside to cool, and subsequently it becomes very hard. To use it, it is softened by heat and well kneaded, when it becomes as pliable as wax.

Many of our readers are familiar with the sand-box used on locomotives to increase the friction on slippery rails and in ascending heavy inclines. By the latest advices from America we learn that it is now proposed to use electricity to effect this. A small engine and dynamo are mounted upon the locomotive, and furnish an electric current, which is passed forward to the rear driving-wheels through the portion of the track-rails lying between them, the passage of the current, which is that known as a low tension current, causing an increased friction between the rails and the wheels. The invention, which is due to Mr E. E. Ries, of Baltimore, has been tried on a gradient of one hundred and eighty-five feet to the mile on the Philadelphia and Reading Railroad. With a train of forty-five cars the ascent was made in twenty-

eight minutes, whereas another trip without the current occupied fifty-five minutes, thus giving a gain of nearly fifty per cent. in the time required for the ascent.

THE CHANNEL BRIDGE.

No novelty attaches to the proposal to form a permanent means of communication between England and France. Amongst the various projects mooted, that of a tunnel has been constantly proposed for the last century. It was not, however, till 1881 that this scheme took shape and was prominently placed before the public, and a commencement made by the South-Eastern Railway Company, with Sir Edward Watkin at its head. An experimental heading seven feet in diameter was driven for some two thousand yards from the English side, by means of the Beaumont boring-machine actuated by compressed air. Progress was maintained at the rate of fifteen yards per day; but legislative powers being refused by parliament, the work was brought to a standstill.

The project known as the Channel Ferry Scheme, brought forward by Sir John Fowler, K.C.M.G., was designed to transport the trains themselves across the Channel in large vessels specially constructed for such purpose. By such means all trans-shipment of goods, or change on the part of passengers, was entirely avoided. The scheme necessitated large and commodious harbours on both sides of the Channel; and though influentially supported, never obtained the necessary legislative sanction, and consequently fell into abeyance.

Turning now to the project of bridging the Channel, we may point out that no novelty attaches to this mode of uniting the two countries which it separates. From the commencement of the present century the idea has been vaguely mooted from time to time, by more or less irresponsible persons, the scheme perhaps most popularly known being that brought forward by M. Thomé de Gamond, who proposed to form thirteen artificial islands in the Channel by throwing in stone until the surface was reached, and then bridging from island to island.

The proposal now placed before the public differs very materially from its predecessors. Rapid strides have of late been made in bridge construction; mild steel eminently adapted for structural purposes has sprung into existence in ever-increasing demand; the methods of founding piers and dealing with caissons and compressed air have received new developments, whilst the successful completion of the Forth Bridge marks an era in the science of engineering. Small wonder, therefore, that the difficult problem of bridging the British Channel, formerly the sport of adventurers, should at length receive serious consideration at the hands of the foremost masters of their craft, who, with a completeness and detail never before attempted, now lay their project before the world. With such names as Messrs Schneider & Co., of Creusot, and H. Hersent; Sir John Fowler, K.C.M.G., and Mr B. Baker—the latter two the engineers of the famed Forth Bridge—the scheme now submitted cannot fail to command popular attention and carry considerable weight.

The route selected for the proposed structure combines directness with shallow water, being from near Cape Grisnez to Folkestone; passing over the banks of Colbart and Varne—a distance altogether of about twenty-four and a half miles; the greatest depth being about one hundred and eighty feet, or about double that founded in at the Firth Bridge.

The bed of the English Channel along this route consists principally of white and blue chalk, strata by no means unsuitable for the foundations of bridge piers. The main spans are 1640 feet and 984 feet; the lesser ones being 830 feet and 328 feet; a clear headway of 180 feet at high-water being allowed for the passage of vessels.

The founding of the piers of this gigantic undertaking, numbering one hundred and twenty, with a maximum depth of water of some thirty fathoms, presents many features of difficulty. The *modus operandi* has, however, been well considered by the designers, who are confident that the problem presents no insurmountable obstacles. Repeated experiments have abundantly demonstrated that the bed of the Channel over the route selected is sufficiently firm to carry heavier concentrated loads than those imposed on it by the piers of the superincumbent girders. Sand and mud lying on the surface of the bed of the Channel will of course be removed, and the foundations laid on the solid substratum. The piers will be floated out and sunk in position, the whole details of such arrangements having been elaborated with considerable care. Compressed air will be employed to temporarily raise the piers, should it be necessary to rectify their position after sinking; whilst, viewing the frequently stormy character of the British Channel, it is proposed to utilise the well-known properties of oil in smoothing troubled waters, when operations threaten to be impeded by bad weather.

The piers, it may be pointed out, will occupy a space slightly exceeding one-twelfth of the section of the Channel; consequently, deleterious scouring action to the bottom with accompanying injury to the foundations will be minimised; whilst the augmented speed of the tide through the bridge, due to diminished water-way, will be scarcely appreciable; though sufficient, it is pointed out, to carry under the spans and clear of the piers any disabled or drifting vessel which might be borne in the neighbourhood of the bridge. The bridge will be lighted at night, each pier forming a light-house. The total height of the structure, measured over all from the bottom of the foundation to the highest points on the towers is six hundred feet.

It is estimated that the work can be completed in twelve years, the first two of which would be devoted to preliminary arrangements and preparations, which of necessity would be on a vast scale, in magnitude corresponding with that of the proposed undertaking.

Operations would commence simultaneously on the French and English sides, a part being proposed in the Bay of Ambletense on the one side, and at Folkestone on the other. Every facility that telegraphic and telephonic communication could afford would be provided in the carrying out of an undertaking that may be fairly classed as stupendous.

It is difficult to grasp the magnitude of the figures involved. The fifty thousand tons of steel

employed in the Bridge across the Firth of Forth sink into insignificance beside the one million tons estimated for that to span the Channel, a sum equal to something like four times the total yearly output of the whole of the Scottish steel works.

Large figures are likewise involved in the estimate of cost, the piers being placed at over fifteen million pounds; whilst the metallic superstructure is estimated to exceed nineteen millions; or a total cost for the entire undertaking exceeding thirty-four millions.

The line, it may here be added, will be double throughout, no carriage-way being provided; the usual refuges for railway servants will be placed at the customary distance along the bridge.

With the military or political phase of the question we do not propose to deal; suffice it to point out that with a view to silence any opposition on this score, and destroy at any moment the means of communication formed by the bridge, the designers provide a swing-span at each end of the structure, under the control of each country.

CHARTREUSE.—In a recent article on this subject it was inadvertently stated that the labels bore the letters 'D. O. M.' These letters form part of the Benedictine labels, not the Chartreuse.—Ed.

DEAD LOVE.

CAN the winds of Winter bring
From the frowning Northern skies
The sweet love-songs of the Spring?
All my heart within me dies
When you bid me sing.

Can the whirling mist of spray
Driving from the angry sea
Bring the blossom to the may?
Leafless, blossomless, the tree
Standeth bare to-day.

Can the heart of Winter hold
Roses of the Summer's prime,
Glory of red Autumn gold?
All the ways are white with rime,
And my heart is cold.

Can I sing of Love to-night
By the grave where Love is lying?
Give me back dead Summer's light
And the south wind's tender sighing—
Then perhaps I might.

D. J. ROBERTSON.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

SOWING AND REAPING.

WE sow as we choose our seed, and we reap as we sow. We cannot change the substance of our husbandry, and as the seedtime so the harvest. Good grain and careful tillage ensure us wealth, abundance, and stability in the years to come; but our tares yield us no stretches of wheat ripening into gold by the sun, our thistles give us no figs. From our lavish plantation of poisonous thorns we gather no grapes for the wine which makes glad the heart of man; of our wild-oats flung broadcast we grind no meal for our children's bread. We reap as we sow; and no power on earth can touch the appointed issue. If we reap as we sow, we garner as we reap. It all depends on ourselves whether we fill our barns with enduring riches or pile them up with perishing and corrupting matter—whether we choose for our possession truth or falsehood. Some of us prefer the falsehoods of life. They are prettier and more seductive than the truths; but the pity of it is these falsehoods are like the leaves which Ribezahl made to look like solid gold—like the pleasant bowers and platters of dainty food by which the Algonquin rabbit beguiled the weasel. Those heaps of golden coin were but glittering cheats to the weak-kneed peasant who had sold his honest manhood for their gain; those bowers of rest and pleasantness were but mounds of dust set round with briars and burs to the beguiled weasel; and both man and beast woke to hurt and shame and sorrow when the morning broke and the trick of the false metal and the disguised disgrace was discovered.

So with our own lives. We choose such and such a path—such and such a manner of being, and as time passes and the seed ripens into the fruit, we find by unalterable experience what is to be our enduring possession. The riot and dissipation of youth, for example, has a harvesting for old age not of the most sufficing character. Time lost, and with time, health and money and more or less of repute, leave gaps in the soul's palace through which the keen winds whistle and

rave. The 'broken record' has always its power to hurt; and 'Oh, I believe he is all right now; but he has been a *mauvais sujet* of the most pronounced type,' is not a very reassuring character where good qualities are wanted. And for the personal experience, what flavour remains in the mouth after a youth passed in idleness and debauchery? Experience? Perhaps so; but experience all on one side only—on the side of thoughtlessness, of want of duty and want of a high ideal. The wild-oats sown and no more left in the sack, then rest and peace and steady walking? Scarcely. Satiety is not true peace. The headache after a drinking bout is not true sobriety. The soul of the profligate who has got tired of his pleasant sins may be sad and sore and sorrowful for all that has been; but cessation is not necessarily purification, and sorrow is not always winnowing. The husks remain. The tares are of the nature of tartarean *immortelles*. Both have been garnered into the spacious barn of life, and both together fill the floor which a wiser husbandry would have heaped up with grain. It is the law of consequences and results, and is as unalterable as that of gravitation.

From pride and a haughty temper, assuming to itself the kingship of men, comes isolation but not supremacy. This is the garnering got from that self-sown plant of personal glorification. He to whom sympathy with others is an unworthy condescension, who demands homage rather than love, and whose pride brooks neither contradiction nor remonstrance, is one who must be content to live without true affection and to die without real regret; but he is not necessarily compensated by the reality of the superiority he has so strenuously believed in. Perhaps at the end of all he learns his mistake. Those piles of golden coin become again the withered leaves they were before they were transmuted by the thaumaturgic power of self-delusion, and he acknowledges the rubbish he has garnered for treasure. His pride and haughtiness have alienated from him all those early friends on whose love he might have counted, to walk with him like fair-haired angels

to the last. He looks back over the procession of the slain and the disclaimed. The women who loved him and the friends who served him pass like ghosts before his memory. To neither, from whom he demanded all, did he give back aught. With his wife he got wealth and devotion; but the stake for which he played once won, he threw off even the merest semblance of regard, the merest gauze of courtesy, and let her learn her lesson of submission and absolute self-abnegation. Her honour was to minister; her reward was his acceptance of her services. Of gratitude, of sense of obligation, of dutiful return, of manly protection in return for her devotedness, he gave not so much as a hair's-breadth. He walked through the garden her love had planted for his pleasure, and he trod under foot all the sweet fragrant flowers with which she had thought to adorn his ways. His pride revolted at the thought that he owed her thanks for her dear work. Not too independent to accept, he was too haughty to acknowledge; and when he had gone through her garden and killed her flowers and her love together, and had gained the barren waste beyond, then he woke when too late to the consciousness of what he had lost, and knew what a sorry harvesting he had made. Deluded by his own pride, like the Algonquin weasel by the rabbit, he woke to the perception of his true place. The temple of his glory, self-created, was but a mound of dust and straw set round about with burs and briars. The fair garden he had disclaimed lay in a mass of broken beauty and destroyed delight behind him. The woman who had loved and dowered him, and who had asked only leave to love him to the end, walked on her own way now with averted face and restricted heart. He had sown the forty-acre field of his holding with scarlet poppies and gorgeous sunflowers, but when the winter came, where were they? Massed into ruin; and the place which they had held and which should have been filled with ruddy fruit and golden corn—empty.

What we sow in perversion of the truth we reap in contempt when the bubble is burst and the fraud discovered. We take some one *en grippe*, make ourselves his enemy, proclaim that enmity to the world, then invent a reason which never had substantial existence, and excuse ourselves by a lie, which repeated often enough, at last sticks and leaves its mark—at the least for a time. With some that mark will always remain. With others of a more candid kind, want of corroborative proof, and honest denial boldly made, have their force on the other side; and the lie falls off clean and entire, and leaves neither smirch nor scratch behind. But a falsehood told by one in authority and with natural influence to a child, receptive and uncritical, is sure to be retained as an article of faith for all the life after; and the cruelty practised by A, the dishonesty by B, the unnatural coldness to, say, a dying brother by C, and so on, remain as fixed in the man's belief as the needle turns to the north and the pointers show the Pole-star. Less than this, however, offers a chance for rehabilitation; still, the lies told in the world, as it is called, though not so permanent, have their own dank aftermath, their own unfruitful harvesting. And how general they are! One of the wisest of all the little saws and sayings by which we do well to

regulate our actions is that of believing only half we hear. The half is a liberal allowance—the grain of salt a scanty one. Divide that half once again; make the grain an ounce, and even then we accept sticks and straws for bricks, and boulders—withered leaves for solid gold. Nothing spreads so rapidly as the burning of brushwood. The crackling of thorns under a pot makes more noise than the steady fire of coal. In like manner a lie, artistically devised and scientifically set agoing, travels far and wide in an incredibly short space of time—the farther and the wider in proportion to its intrinsic levity and unsubstantiality. The wife who ran away from her husband according to the maker of the fiction, simply went suddenly to her mother, who had been taken as suddenly ill. That Deuce-Ace travelled in the same train was a coincidence, no more. It served, however, as the sack into which that ingrained gossip dipped his fingers to sow the fast-spreading weed of falsehood. He reaped the harvest of shame when the thing became known for what it was, and the truth beat the lie out of the field.

Cognate with this kind of husbandry is that of generalised ill-nature—of insinuations which are essentially slanderous, of ridicule which is false presentation, of sneers which are ingratitude, of comments which are treachery. This, too, is the kind of thing that obtains in the world, and whereof the proficient are accounted good company and amusing dinner guests. Reputations which hitherto had been unsullied, now smeared and soiled by the sooty fingers of this husbandman of ill-nature, lie on his track, as defaced statues and broken columns mark the track of a hostile force. Innocent actions turned the other way round, and the light distorted so that the angles shall show and the hills and hollows be reversed; personal characteristics dealt with in the same way, and a fund of evil shown to exist where is nothing but a harmless idiosyncrasy; a character pulled to pieces, and not a merit left belonging to it; friends laughed at when they are not traduced, and the whole living drama tossed up like so much foam from bitter waters; confidences half revealed, and the rest left to the exaggeration of the imagination—this is a little corner of that cruel field which the congenitally ill-natured plough, sow, and harrow. And the harvest? Well, the harvest is one of universal suspicion, of unconcealed distrust, of quiet shrinking from dangerous association. The timid fear him; the loyal condemn him; the frank dislike his doubleness of face; the kindly feel his satire as it were the sting of a scorpion—the fang of a serpent. Even those who laugh with him when he laughs at others, fight shy of him for their own intimacy, and his 'cleverness' simply fills his barns with arid dust where is neither food nor beauty. He reaps as he sows. He sows ill-nature and he reaps repulsion. He sows sarcasm and insinuated slander, and he reaps fear and condemnation. He sows ingratitude, duplicity, treachery, and he reaps the honest scorn of those who do not wear two faces under one hood, and whose lives are single as their words are true. The Indian expression of the 'split tongue' is the rightful description of those behind-back slanderers, ridiculers, satirists. Yes; we reap as we sow. If we sow faith and truth,

loyalty and uprightness, sincerity and sympathy, we shall reap of the like, and our barns will overflow with the love and esteem of our fellows, bound to us by the golden chain of trust and esteem. If we sow the reverse we shall reap accordingly, and old age will find us dishonoured and disesteemed, the noted enemy of many and the cherished friend of none.

A DEAD RECKONING.

BY T. W. SPEIGHT.

CHAPTER XVI.

NEVER had the little town of Cumberhays been stirred to its depths as it was on a certain April morning, when it awoke to find that it had rendered itself famous after a fashion which would cause its existence to become known wherever an English newspaper penetrated. Its name would be in everybody's mouth for weeks to come. It felt that it could never again sink into utter obscurity.

For the prisoners—about whose alleged attempt to rob the train all sorts of wild rumours were afloat—had after their capture been put into the train and brought on to Cumberhays, and were for the present lodged in the town jail. The magistrates would assemble at ten o'clock, when the preliminary inquiry would take place. But even a deeper interest, if that were possible, centred itself in the arrest of the alleged murderer of the Baron von Rosenberg, who was said to have actually been working as a signalman on the line for the past three or four months. It was dreadful to think that the lives of several hundreds of respectable people should have been at the mercy of such a miscreant!

The town-hall was besieged by an excited crowd long before the opening of the doors, and had the justice-room been three times larger than it was, it might easily have been filled three times over. Among the foremost ranks of the surging crowd, and maintaining his position with passive tenacity, was a man on whom many curious eyes were bent. He was a foreigner—so much was evident at a glance—and that of itself was enough to excite the curiosity of the good folk of Cumberhays, many of whom had never been a score miles from home. He was very lean and very sallow, with drawn-in cheeks and sharply defined cheek-bones. He had deep-set eyes, black and burning, with something in them of the expression of a half-famished wild animal. He wore small gold circlets in his ears, and was dressed in a coat of frayed velvet, with a soft felt hat; and a coloured silk handkerchief knotted loosely round his throat. He spoke to no one, and no one spoke to him; but now and then his lips worked strangely, as though he were holding a silent colloquy with some invisible companion. He was the one man in the crowd who was the least incommoded by the crowd. Those nearest to him shrank a little from him, involuntarily as it were. He was a being of a different world from theirs, and they knew not what to make of him.

Jules Picot—for he it was—had arrived in Cumberhays at a late hour the preceding night, having walked there from another town about

a dozen miles away. By what strange chance his wandering footsteps had brought him by many devious paths to this place of all others, and at this particular time, will be told a little later on. He had hired a bed for the night at the *Wheatheaf Inn*, a cheap and unpretentious hostelry. He was up and had ordered his breakfast by eight o'clock next morning, and it was while waiting for that meal to be brought him that his attention was attracted by some conversation in the taproom which he could not help overhearing. The pallor of his face grew deeper as he listened; but whatever other emotion the change might arise from, it certainly had not its origin in fear.

'Soh! It is for this that I have been brought here,' he muttered, half to himself and half aloud, in French. 'Now I understand.'

Going into the taproom, he put a few questions to the men to whose talk he had been listening. Having ascertained what he wanted to know, he left the house without waiting for his breakfast, and bent his steps in the direction of the town-hall. At a quarter to ten o'clock, when the doors were thrown open, Jules Picot was one of the first to push his way forward, or to be pushed forward by those behind him, into the small penned-up space allotted in the justice-room of Cumberhays to the general public. In three minutes the place was crammed to its utmost limits.

A few minutes after ten, the magistrates entered one by one and took their seats, their clerk having preceded them by a few seconds. They were three in number, all venerable gentlemen. One was partially blind; one partially deaf; while the third, who had a very red face and took the lead in everything, was quick-tempered and aggressive in his manner. There were two cases of drunkenness and one of theft to be disposed of before the great sensation of the day would begin.

Everybody seemed relieved when they were over; and presently a flutter of intense excitement ran through the court as three men, in charge of as many constables, filed in and were placed in the dock. Then, after a brief pause, a fourth man was ushered in whose left arm was supported by a sling, and a murmur ran round that this was the alleged murderer of the German Baron. A moment later another door opened, and there glided in a female in black, closely veiled, who sat down on a chair in the background which one of the officials handed her with a bow. The prisoner with his arm in a sling was also allowed to be seated a little way from the dock in which the other men had been placed.

When the mountebank beheld Gerald Brooke, whom he still knew only by the name of 'Mr Stewart,' marched in as a prisoner, and when he saw, and his quick eyes recognised, the veiled figure in black who entered immediately afterwards, he was seized with a vertigo, which caused the room, the magistrates, and the prisoners to surge up and down before his eyes as though they were being tempest-tossed at sea. 'Mon Dieu! est-il possible?' he exclaimed half aloud. Then he buried his face in his hands for a time, while a cloud seemed to lift itself slowly from his brain, and much became clear to him that had been dark before.

The charge against the first three prisoners was one of assault and attempted robbery; but against

one of them there was a supplementary charge of attempted murder. That against the fourth prisoner was the much more serious charge of murder. But from what the magistrates could understand of the case at present, this fourth prisoner was so mixed up with the charge against the other three—he being the man who had been assaulted and bound and afterwards shot by one of them—that the poor gentlemen, who had never before had to investigate a case of such gravity, or one which presented so many peculiar features, were fairly at their wits' ends to know how to deal with it from a strictly legal point of view. Thus it fell out that the whole of the prisoners found themselves in court at the same time. It was now, however, suggested by the clerk that the prisoner on the capital charge should be put back while the examination of the others was being proceeded with. This suggestion was at once acted upon.

After the remaining prisoners had answered to the names entered on the charge-sheet, the first witness was called, but not till the red-faced magistrate had intimated that he and his colleagues only intended to take sufficient evidence that day to justify a remand. The first witness proved to be Mr Sturgess, a London jeweller. His evidence went to show that, accompanied by a trustworthy assistant, he had left home the previous day on his way to Lord Leamington's seat, a few miles beyond Cumberhays, having in his charge a box containing jewelry to the value of several thousands of pounds. All had gone well till he reached Greenholme, at which place he had to wait an hour and change to the branch line; but on his arrival there, he had found a telegram awaiting him from his partner in London, in which he was told on no account to pursue his journey without first obtaining an escort of four or five constables. No reason was furnished by the telegram for taking such extraordinary precautions, and he could only surmise that an attempt was about to be made to rob him of the box, and that by some means his partner at the last moment had obtained wind of the affair. Fortunately, through the courtesy of the police authorities at Greenholme he experienced no difficulty in obtaining the required escort, and under its protection he resumed his journey by the next train.

The next witness to answer to his name was the driver of the train, who deposed to everything having gone right till he was just inside the distance signal of Cinder Pit Junction, which showed 'line clear,' when he and his mate were startled by the explosion of a fog-signal. He at once whistled and put on all the brake-power at his command, and could not have gone more than forty or fifty yards farther before a second signal exploded; and then he could just make out the figure of a woman standing on the embankment and beating the air with both her arms as a sign for him to stop, which, as the brakes were on already, was not long in doing. After that, the police took charge of the affair, and he did just as they told him.

The next witness called was Margery Shook. She had been sitting out of sight behind a large screen which sheltered their worships from any possible draughts at the lower end of the room. As she entered the witness-box she shot a glance

of venomous hatred towards Crofton, which would have killed him then and there if looks had power to slay. The nature of the evidence she had to give we know already. More than once her peculiar phraseology caused a titter to run through the court, which was, however, promptly suppressed.

Clara Brooke was the next person called upon. As she raised her veil her eyes met those of Crofton for a moment, while a faint colour suffused her cheeks, only to die out as quickly as it had come. A low murmur of commiseration passed like a sigh through the court; and the eyes of many there filled with tears when they beheld her pale beautiful face, for it had been whispered about that this was the wife of the man who was accused of murder. The evidence she had to offer was given clearly and unhesitatingly; with the purport of it we are sufficiently acquainted already. When she had told all she had to tell, she let her veil drop and went back to the seat she had occupied before.

The next and last witness whose evidence it was proposed to take at present was the Greenholme sergeant of police. He told how he had been instructed by his superintendent to take four men and accompany the gentleman from London as far as Cumberhays. Then he narrated how the train had come to a stand in consequence of the explosions of the fog-signals; and how, when he and his men alighted from it, they had found the witness Margery Shook, who gave them to understand that the train was about to be attacked a little way farther on. How the girl had scarcely finished telling them this when up ran the signalman, who had been released by his wife; and how, under his guidance, he, witness, and his men had succeeded in surprising the would-be thieves and in capturing three of their number; and finally, how the signalman had been severely wounded by Crofton, one of the prisoners, firing his revolver point-blank at him.

'You have omitted one little episode,' said Crofton in cold measured tones as the sergeant was about to step down from the witness-box; 'you have forgotten to tell these worthy gentlemen that it was I who recognised the so-called signalman as Gerald Brooke, the man charged with the wilful murder of the Baron von Rosenberg, and that I denounced him as such then and there.'

'That is so, your worships,' said the sergeant.

'We quite understand that already,' remarked the red-faced magistrate; 'but it is a point on which we need not enter at present, more especially seeing that the prisoner in question has already admitted that his name is Gerald Brooke, and that he is in point of fact the man for whose apprehension a reward of three hundred pounds is still unclaimed.' With that the magistrates laid their heads together and consulted for a little while among themselves.

By Picot, sitting quietly among the general public and watching everything with restless burning eyes, all these proceedings were only imperfectly understood. Why Gerald Brooke had been brought in a prisoner and almost immediately taken out again without any charge being brought against him, was a mystery to the mounte-

bank. Neither could he understand how 'la belle madame' and 'Margot,' as he termed them, came to be mixed up in such a strange fashion with the prisoners at the bar, in one of whom he had at once recognised the man he had gagged and bound to his chair in the house in Pym's Buildings. He lacked the key to the situation, and wanting that, he could only look on and listen, and feel himself becoming more bewildered after each witness that appeared on the scene. Not that he troubled himself greatly about these things; something of much deeper import lay at the back of all his wandering thoughts about this matter or the other. He had been led to that place, his footsteps had been mysteriously guided thither—he could see it all now—for a certain purpose, and that purpose, as he sat there, was never for one moment out of his mind.

The magistrates having brought their brief consultation to an end, intimated that the prisoners at the bar would be remanded till the following Monday. They were at once removed; and after a brief pause, Gerald Brooke took his stand in their place. Having answered to his name in the usual way, the red-faced magistrate leaned forward a little to address him. 'Gerald Brooke,' he began, 'you stand charged on the verdict of a coroner's jury with the wilful murder of Otto von Rosenberg, commonly called the Baron von Rosenberg, at Beaulieu, in the county of —, on Thursday, the 28th day of June last. The crime having been committed outside the jurisdiction of this court, all we have now to do is'—

Suddenly a man with gold circlets in his ears and holding a soft felt hat in his hands stood up in the body of the court, and addressing himself directly to the magistrate, said in a voice which all there could hear: 'Pardonnez moi, s'il vous plait, monsieur, but I—Jules Picot—and not the prisoner at the bar, am the man who killed Otto von Rosenberg.'

THE SECRETS OF A CATALOGUE.

In the middle of the British Museum Library the great Catalogue is ranged on circular shelves for the surrounding readers to consult. There are thousands of volumes of it, each bound in blue or red leather, shod with brass, and containing in their creamy pages the names of authors in alphabetical order and the titles of their works. This formidable series of plain ledgers does not look very entertaining, and most of the readers who prowl through the jungle of its contents are seriously hunting down their prey. But to the lover of books it is at least as interesting as the catalogue of a museum to the genuine antiquary; and even the unlearned in rambling through its pages may find some curious secrets hidden in its recesses. For the sphere of thought has its relics and nicknacks as well as the material world, its vestiges of old myths and creeds, its fossil theories and dry bones of philosophy, its mummied worthies and stuffed characters, its ancient utensils of wisdom and ornaments of diction, its tomahawks of satire and war-clubs of debate, its freaks and marvels of the mind.

If some cases the same subject or name will extend through several volumes: 'Bible,' for instance, through twenty-one with a special

index volume of its own. 'England,' again, has sixteen volumes devoted to it; while 'Scotland' has five, and 'Ireland' three. Certain surnames also run through several volumes and have their own sub-index. The members of the great Smith family, for example, monopolise no fewer than nine volumes, and have attained the dignity of a special index. The Smiths, in fact, by number and importance, are apparently the most illustrious of all the British clans. The Smiths have been everywhere and done everything. There are Smiths who have distinguished themselves in the senate and on the battlefield, in the study and the laboratory, in the pulpit and at the bar. The Smiths have been poets and orators, philosophers and statesmen, novelists and men of science, travellers and warriors. The Browns, the Joneses, and the Robinsons are far behind the Smiths. While the Joneses have two volumes, and the Robinsons have one, the Browns have only the major part of a volume; and we are driven to the conclusion that either the Browns are less numerous than their colleagues, or that their undoubted talents do not flow in literary channels. No name, however, is absolutely undistinguished; and the possessor of even the unpretending patronymic Blank will happily find in this veracious chronicle a roll of famous Blanks enough to swell his heart with gratitude and pride. Sometimes a single great writer, like a tribe or nation, appropriates a section of the Catalogue to himself, and forms as it were a cult, under the head of which a whole library of books are entered. Such are the great poets, Homer and Dante, Shakespeare, Molière, and Goethe.

There is, practically speaking, only one Shakespeare, for though there have been a few other authors of the name, notably a writer on India, these are of no great consequence. William, the giant of his race, extends through over five volumes of the Catalogue, far more than any other author, not excepting Homer. These include the numerous editions of his works, from the precious first folios of the early part of the seventeenth century down to the penny Shakespeares of to-day; the innumerable selections and 'beauties' extracted from them, and published under fancy titles—'Garlands' and 'Gems,' and 'Calendars' and 'Birthday Books.' Along with these are the various translations in almost every European language, hundreds of essays and criticisms, lives, parodies, operas, and travesties. While the British editions (chiefly London) are sprinkled over the intervening period since his death, most of the foreign translations date from the present century, though some appeared in the last, notably a French edition of the plays, published at Paris in 1746; a Bohemian edition of several plays and poems at Prague in 1778; an Italian one of 'Othello' at Venice in 1797; and probably some German editions. For of all translations the German appear to be the most numerous, and they come from most of the large towns of the empire. Next in point of number, and running the German pretty close, are those of France, chiefly from Paris. After these follow the Italian, Spanish, Dutch, Russian, Scandinavian, and various other translations.

If we may judge by the evidence of the Catalogue, and perhaps we may in a general sense, 'Hamlet' and 'Macbeth' are the two most popular

plays of Shakespeare, or 'Szekespira' as the Poles call him. Hamlet is the most polyglot of princes, and soliloquises in his native tongue, not only in Copenhagen and Elsinore, but at Reikjavik, in Iceland, where Jochumsson's translation was published in 1878. He discourses in most excellent German, French, Italian, Spanish, Portuguese, Russian, Dutch, Swedish, Polish, Hungarian, Greek (Constantinople, 1874), Romaine (Athens, 1858), and even Bulgarian (Bucharest, 1882). There are a number of editions in the leading tongues, and two in Portuguese, one by His Majesty King Louis of Portugal, and privately printed at Lisbon in 1877; that in the Library being a presentation copy. Of English editions, the most important is the original quarto of 1603, containing the 'Tragicall Historie of Hamlet, Prince of Denmarke,' by William Shakespeare, as it hath been divers times acted by His Highnesse Servants in the Cittie of London, and also in the two Universities of Cambridge and Oxford, and else-where. For N. G. and John Trundell. This copy lacks the title-page, and has no pagination. The only other known to exist belongs to the Duke of Devonshire, and wants the last leaf. There are, of course, fac-similes of this volume, as of other rare editions of the plays, in the Library. Then there are operas, travesties, and burlesques of 'Hamlet,' though it might seem at first sight a kind of sacrilege to parody this splendid tragedy. There is a German travesty published in 1800, a comic opera by Cumberland dating 1829, and a 'darker drama' by Griffin, entitled 'Hamlet the Dainty, an Ethiopian Burlesque,' produced in 1860, all in advance of the present so-called frivolous days. In addition to these are many pamphlets and treatises on the play, some dealing with its historical source in Saxo Grammaticus, and contemporary allusions in Montaigne; others with the meaning, the 'mission,' the 'character,' the 'madness,' and the 'mystery' of Hamlet. With its supernatural element and real or affected madness, 'Hamlet,' like 'Macbeth,' is an admirable study for the critics, and like the parasites of parasites, they occasionally attack each other. Then there are works on the obsolete words in 'Hamlet,' and such curios as 'The Bubble Ghost and his Son,' a 'Throw for a Throne,' maintaining that Shakespeare's words show Claudius to have been innocent of murder.

'Macbeth,' too, has its numerous foreign translations, its operas and travesties, its studies of the original source in Holinshed's Chronicles, and its ingenious commentators. There was a Russian edition as early as 1837, one published at 'Derwent' in 1845, another at Posen in 1857, and one at 'Jassi' in 1864. Madrid had an edition in 1818, and Stockholm in 1838. 'Romeo and Juliet,' is popular, but not nearly so much so as might have been expected. 'Othello,' 'King Lear,' the 'Merchant of Venice,' the 'Merry Wives of Windsor,' the 'Midsummer Night's Dream,' the 'Tempest,' are all fairly well represented in translation; so is 'Julius Cæsar,' but none so well as 'Hamlet' and 'Macbeth,' or even as 'Romeo and Juliet.' There was a translation of the 'Merry Wives' at Wilno in 1842, a Bulgarian one of 'Cæsar' in 1879, and a Greek one of 'Lear' in 1870. The English historical plays, as might be supposed, are not well represented by translations, if we except 'King Richard III.' A translation of 'King

Henry VI.' appeared at 'Bánfalván' in 1862. There are very few of 'Measure for Measure,' and still fewer of 'Love's Labour Lost.' Of 'Pericles' there is, of course, a German translation (1838), for the Germans appear to excel all other nations in translating, especially in the case of Shakespeare. Under the head of 'Pericles,' too, there is an Anglo-Saxon version of the story of Apollonius of Tyre, on which the play is founded.

The doubtful plays of Shakespeare also claim a considerable space in the Catalogue, and have been translated, at least by the Germans, and republished by the Americans. Such are 'The Two Noble Kinsmen,' 'The London Prodigal,' 'Thomas Lord Cromwell,' 'Sir John Oldcastle,' 'The Puritan,' 'Loerine,' 'The Yorkshire Tragedy,' 'The Fifth of November,' and so on. Of the Sonnets, there are a variety of translations and a large number of 'Selections.'

The miscellaneous literature of Shakespeare is very voluminous. With regard to the sources of his plays there are, in addition to some mentioned above, treatises on the Lives of Plutarch and the passages of Aristotle and others which illustrate his writings, together with Rich's tract 'News from Virginia' (1610), describing adventures supposed to be referred to in the 'Tempest'; an early jest-book possibly used by Shakespeare; a collection of the plays and romances from which he may have drawn, entitled 'Shakespeare's Library'; and a rare book known as 'Beware the Cat,' published in 1570. Then there is quite a list of books and articles on his art and work, his predecessors, contemporaries, and successors. We have his 'mental photographs,' his 'garden of girls,' his 'England,' his 'Altenengland,' his 'morality,' his 'religion,' his self-knowledge, his genius, his humour, his folklore, and so on. We have 'Shakespeare's Heroines,' the very 'Girlhood of Shakespeare's Heroines'; we have the 'Learning of Shakespeare,' the 'Law in Shakespeare,' 'Shakespeare and the Bible,' 'Shakespeare and Short-hand,' essays on the varieties of mania exhibited in some of his characters, the 'Animal Lore of Shakespeare's Time,' the 'ornithology' of Shakespeare, the 'Natural History of the Insects mentioned in his Plays' (a gruesome subject), 'Under the Stars,' or his work in the light of astronomy, the 'Flowers of Shakespeare.' Many have puzzled over the question of his calling as demonstrated by his writings, and hence we have such books as 'Was Shakespeare ever a Soldier?' 'Was Shakespeare a Lawyer?' 'Shakespeare as a Physician,' 'Shakespeare as an Angler,' as though a man following one craft, especially literature or acting, could not learn something of another. Then we have such works as 'Shakespeare and his Times,' the 'Rural Life of Shakespeare,' 'Shakespeare in Germany, in America, in Griechenland,' and 'West Indian Illustrations.' Of course, there are 'Tales' and 'Stories' from Shakespeare, and equally, of course, the irrepressible apologist with his 'Shakespeare not an Impostor.'

Comparisons are another ordeal which the great writer has to bear, and hence we have Shakespeare and Dante, Marlowe, Bacon, Molière, Goethe, Voltaire, Scott, Chateaubriand, and so on. We have his errors pointed out, his obscure passages expounded, his obsolete words, the pronunciation of English in his day, and one gentleman has investigated the position of the English adjective

in his language. Some person discovers that he wrote ballads on the Spanish Armada; another exposes the forgeries at Bridgewater House; a third pens an imaginary conversation between him and the Earl of Southampton; a fourth treats of his 'curse'; a fifth supposes his ghost to address the British army in the '45 to the tune of 'Britons, Strike Home;' and a sixth ingeniously fabricates a series of double acrostics from his plays.

The doubters are also in their place, some asking 'Who wrote Shakespeare?' or 'Was Shakespeare Snapleigh?' and others, more bold, discoursing on the 'Shakespearean Myth,' or the 'Great Cryptogram.'

His birth, life, and death is another fruitful source of literature. We have books on his pedigree, his coat-of-arms, his birthplace, school, and home, the 'rogues and vagabonds' of his youth. 'Shaxpere or Shakespeare? Was A ap Roberts that butcher's son of Stratford-upon-Avon who is recorded by Aubrey as having been an acquaintance of Shakespeare in the early days of the great poet? And was Shakespeare an apprentice to C ap Roberts? We have fac-similes of his indentures, his coat-of-arms, his will, the traditional history of his crab-tree, the 'actors of his time,' and descriptions of his house; his last days, his grave, his death-mask, busts and portraits, his monuments and centennial celebrations, with odes and lines commemorative of his genius. Lastly, we have an account of how his skull was stolen and found, and of an interview between his ghost and David Garrick.

We may liken Shakespeare to one of those prodigious trees, the giants of the tropical forest, rearing its lofty crown high over its fellows, and spreading wide its enormous branches, encumbered with an airy wilderness of creepers, parasites, and winged tenants, some of which tend to support and beautify their foster-parent, and others only harbouring in its shade to blight and strangle, or to ravage and destroy.

Homer has two volumes of the Catalogue to himself, and has apparently been translated into a greater diversity of languages than Shakespeare. There is, for instance, an edition of the 'Iliad' in Gaelic, of 1813, and Books 1 to 8 in the Irish Organic character, dating from 1844. A Romaic edition dates as early as 1640; and there is one published at Liptzk in 1504. Of the 'Odyssey' there is a French edition dated 'Lutetiae, 1566,' and another 'Parisus, 1582.' An Erse translation was brought out in 1836; but the 'Iliad' appears to be the more widely appreciated of the two. The comments upon Homer run in much the same grooves as those upon Shakespeare and, indeed, the other great poets. Thus we have the 'Influence of his Poems on the Greek Nation,' 'Tales from Homer,' the origin and growth of the poems, the 'True Nature and Design of the "Iliad,"' 'Ulysses as delineated by Homer,' 'Homeric Flora and Mineralogy,' 'The Sense of Colour in Homer,' the 'Topography of Troy, the Age of Homer, the original genius of Homer, his post-epic or imitative words, an 'Apology for Homer,' Homer and Virgil, Homer and Dante, Homer and Goethe, 'Homeric Doubts,' the 'Pretended Tomb of Homer,' and so forth.

Dante has a fraction of one volume to his share, but the entries being all in close type, it does not

compare well with the written and printed lists of Shakespeare and Homer. There are many translations of the 'Divina Commedia,' including one in the Catalan tongue, printed at Barcelona, one in modern Greek, and another in Hebrew; but apparently not so many as in the case of 'Hamlet' and the 'Iliad.'

Molière has about half a volume, written and printed. His plays have been translated into most of the European languages; but there are comparatively few comments upon them in the Catalogue. Some of the English adaptations have rather curious titles; for example, 'The Irish Doctor, or the Dumb Lady Cured,' from 'Le Médecin malgré lui.' Charles Reade, we know, translated the 'Malade Imaginaire' into 'The Robust Invalid.'

Corneille has a good many pages and a variety of translations. Goethe has about half a volume, printed, including translations and a miscellaneous literature which reminds us of Shakespeare. 'Faust' is the leading work, and has been translated into most European tongues, including Servian, Greek, Ruthenian, Hungarian, and Hebrew, with selections in Romaic. Tales, operas, legends, and parodies in English, French, and Italian have sprung from 'Faust,' and a flourishing literature of comment.

Schiller, a voluminous writer, has two volumes, but not yet printed, as in the case of Goethe. There are not so many translations of any of his plays as there are of 'Faust;' but the 'Song of the Bell' appears to be popular; and 'Don Carlos' has appeared in English, French, Italian, Spanish, Dutch, and Hungarian.

Milton, like Schiller, has two volumes of the Catalogue, chiefly written. The 'Paradise Lost' has appeared in the principal European languages; and there is a Welsh translation of 1865, and a Manx one, dated Douglas, 1796. Milton does not seem to invite many commentators; but the comparison between him and the Dutch Vondel is worthy of note. Chaucer has twelve printed columns of the Catalogue, and Spenser some forty written pages. Byron has twenty-seven closely printed columns and more; their well-thumbed condition attesting the poet's popularity. Indeed, the dirtiness of the pages is the best indication of an author's fame; and in looking at the edges of the Catalogue one can generally tell whether a volume contains a popular writer. Selections from Byron have appeared in most of the European tongues, including Polish, Bohemian, Dutch, Icelandic, and Roumanian.

Burns, in spite of his rustic dialect, has thirteen closely printed columns, well thumbed, like Byron's; with several German and French translations, and a Swedish, published at Helsingfors.

Shelley has some forty written pages, well thumbed, but few or no translators. Tom Moore, on the contrary, is well translated, especially 'Lalla Rookh,' one published at Jönköping. Wordsworth, though occupying five well-thumbed pages, is apparently innocent of foreign translation, if we may judge from the Catalogue. Tennyson has fifty written pages, and some of his poems, notably the 'Idylls,' have appeared in the leading European languages, including Hungarian, Spanish, Dutch, and Danish. Longfellow has nearly as much space, and a greater variety of translations. 'Evangeline' is a favourite work,

which, besides its many European editions, has been published in Portuguese at Rio de Janeiro, in Brazil, in German at Milwaukee, and French at Quebec; while 'Hiawatha' has found its way into Russian and Dutch, amongst other tongues. Victor Hugo, however, is more polyglot still, and occupies fifty pages of the Catalogue. Scott, as poet and novelist, has two volumes to himself, and has appeared in most of the European languages.

Dickens has twenty printed columns, well thumb'd, and a great variety of translators, including Hungarian, Dutch, Ruthenian, and others. Thackeray has thirty-two written pages and some scattered German, French, Italian, and Danish translations; but 'Vanity Fair' in Spanish has appeared in Mexico ('Las Fier de las Vanidades'), and there is a Schiedam edition of the 'Virginians'. Bulwer-Lytton has fourteen printed columns and many European translations of novels or plays, including certain in Greek and Hungarian; in France he appears to be particularly popular, perhaps because of his official connection with the country. George Eliot has three printed columns, and a translation or two in German, French, and Italian. 'Silas Marner', too, appears as 'A Raveloei Takacs' at Buda-Pesth. Charles Kingsley has only some twenty-four written pages, and but one translation, namely, the 'Heroes', in Greek.

CHARLIE RANSOM.

A STORY OF THE OIL COUNTRY.

IN FOUR CHAPTERS.—CHAP. I.

UPON the broad Western Continent, it is not the mountain fastnesses of Nevada or the rocky canons of Colorado, nor yet the sweeping plains of Nebraska and Dakota, which alone furnish rough-and-ready phases of human nature. Far removed from the Pacific coast, and within the bounds of a State whose easterly limits form a portion of the Atlantic shore-line, there is yet to be found a peculiarly wild and out-of-the-way district known as the Pennsylvania Oil Regions, or, locally, by its more familiar name of 'The Oil Country.'

True it is that there are few spots along the Alleghanies from which a man with a fairly serviceable pair of legs might not, upon a day of average length, start out at sunrise and, before sundown, reach some point of civilisation marked by a railroad station or a post-office or at least a public highway. And yet in those same Alleghanies, Mr Bruin is still met far too frequently to be considered a rarity or to secure for him a welcome from the oilmen; while rattlesnakes, wild-cats, and other necessary evils of thinly populated territories abound in rich profusion.

In the Oil Country the perpetual and imminent danger from fire and explosions of a most fearful and far-reaching character deters all those not dependent upon the oil-wells for subsistence from settling within its limits; while those who find it necessary to reside there and delve from day to day, erect houses and other dwellings of a cheap and temporary character. This, latter

course is pursued for two reasons. The first, because of the inability to effect insurance against fire, backed by the unpleasant knowledge that at any moment a huge conflagration may sweep away all their belongings. The second is the ever-present possibility of the failure of the wells, which frequently run dry with appalling suddenness. Consequently, Pan Handle City enjoyed no reputation, either at home or abroad, for elegant residences or massive business blocks. And the oil which rushed upwards from the score of scattered wells that formed the Pan Handle 'field' caught its first glimpse of the face of Mother Earth from no unfavourable point of view.

The Tomhicken Valley was formed by two bold spurs of the Alleghanies, the ridges of which were for a long distance about ten miles apart. Down this Valley, in a south-westerly direction, flowed a tributary of the Alleghany River—the Tomhicken Creek, navigable, except during the dry season and in winter, for very small vessels. During the autumn months, after the full rains had replenished the stream, the Tomhicken became very much alive with light craft of every conceivable kind—barges, boats, punts, rafts, and one or two pigmy steam-tugs—conveying the summer output to the great refineries at Pittsburgh, Buffalo, and New York, for the winter market. There was no railroad yet in the Tomhicken Valley, and the oil-producers of Pan Handle City were compelled to take every possible advantage of the fickle little river, along four miles of whose banks their wells were scattered.

For six or seven years the Pan Handle 'field' had 'held out,' and, while there is nothing reliable about an oil-well, there was every apparent prospect that the flow would continue for half-a-dozen more years—or longer. There were no 'gushers' at 'the City,' so no one became, with astonishing rapidity, immensely rich. On the other hand, so long as there was a living to be made from the slow but sure yield of the dirty, greasy fluid, none of the original settlers left the Valley, and the population remained steady.

Gradually, a new idea dawned upon the more thoughtful among the toilers for oil at Pan Handle City. Some there were among those men who had brought with them, when oil was first 'struck' in the Tomhicken Valley, not only young wives, but babies and little toddlers. These during the intervening years had grown to girlhood and boyhood, and their ranks had been frequently replenished by new arrivals, so that, while the adult population had remained practically at a stand-still, a considerable number of juveniles now looked to the Pan Handle wells for supplies of bread and butter. Having recognised the fact that the children were increasing in years and in numbers, the same thoughtful citizens read in that fact an important problem, which, to their credit be it said, they at once proceeded to solve.

Hitherto, schoolhouses and churches had been deemed quite as superfluous as gas-lamps or hansom cabs. But on the day following an important after-dinner conversation, held near the

Jerrick of Well No. 4, between Tommy van Horn, Captain Peter Lamson, and their 'pardners,' Pan Handle City was stirred from centre to circumference by notices nailed to the derricks of all the larger wells. These notices, each of which was a counterpart of the others, were alleged to have emanated from the scholarly pen of 'Cockney Ted,' a diminutive Englishman of doubtful age, who gloried in the fact that he had graduated, at the tender age of twelve, from a worthy institution in London known as the Hoxton Ragged School. To hear some of his friends in the Valley—especially the women, who were staunch admirers of 'Cockney Ted'—one might have been excused for supposing Ted to be a combination of Senior Wrangler, First Prizeman and Gold Medallist, with D.C.L. thrown in.

The important notice read on this wise :

Ralley round the Flagg, boys!—To the Cifersuns of Pan Handell City.—A importint meantin to diskuss the Skul'd Quesching will be helt in the barril howse of Wel No. 4 on Satterly nite at Sevin o'clock.—Come Erly! Ivverybody Cume!

Well No. 4 was one of the largest in the Pan Handle 'field,' and its owners, 'Captain Peter Lamson and Company,' did such a thriving business that they employed coopers to make and repair barrels exclusively for their own trade. For this work they had erected a spacious shed, known in 'the City' as No. 4 Barrel House.

Upon the occasion of the meeting, one delightful midsummer evening, the Barrel House presented an animated appearance. Some thirty or forty men were there gathered together—a number which represented fully seventy-five per cent. of the voters of the settlement, and exactly one hundred per cent. of those who appreciated the advantages of even the most slender knowledge of the 'three Rs.' There were no seats provided beyond the heavy barrels, which were freely utilised by those present, and none of the men removed their hats. But the best order prevailed. Captain Peter was voted to the chair by acclamation, his first official act being the appointment of Cockney Ted to the post of Secretary. Then Tommy van Horn, a shrewd Pennsylvania Dutchman, briefly and concisely explained the object of the meeting; and the very interesting discussion of the subject which followed culminated, near midnight, in a series of resolutions which occupied the little Londoner all the daylight hours of the following Sabbath in committing to a sheet of very oily wrapping-paper. The resolutions were in effect to subscribe money for a school and a teacher and to appoint a managing Committee.

The Committee lost no time in getting to work. The first assessment of two hundred dollars was speedily secured; and three weeks after the meeting, a neat frame-building stood four-square to the winds which sometimes swept across the Tomhicken Valley. When it was completed, Chairman-of-Committee Lamson said to a small knot of his confrères and constituents: 'There ain't no frills nor flounces nor owt o' sech truck about it, but it'll wear all the better fer thet there, and don't you forget it! Blame me if I don't think it's pretty near a dandy: there's a winder and a door on the outside; and inside there's a desk and a cheer fer the schoolmarm,

and benches fer the kids; and, God bless my soul, boys, what could you wish for more?'

There really was nothing more to wish for, except—a teacher, the securing of which rather necessary adjunct to a schoolhouse was indeed an important, and not unpleasant, part of the duties of the Committee, or such of its members as might be detailed to make the selection.

Although there was no official custodian of Uncle Sam's mails at Pan Handle City, there was an individual commonly accorded the title of Postmaster. This was old Steve Smiley, the possessor of a team of sorry-looking mules, which he 'hitched up' every Monday morning to his buckboard wagon, and so wended his way over the North Mountain to the post-office at Mesopotamia Cross Roads, a village of some importance, about eight miles from 'the City.' Steve was a combination of carrier, parcels-deliverer, and postman, and his business was of such a steady and regular character that he had actually caused some cards to be printed at the office of the *Mesopotamia Mirror* which announced a scale of charges, ranging from twenty-five cents for the transportation of a 'trunk, average size,' to five cents for a letter or any number of letters for the same addressee. The same cards afforded additional information to the effect that passengers by the buckboard—and Steve could only by close crowding accommodate two besides himself—would be charged the sum of 'fifty cents for the round trip.'

For their letters the Pan Handle people were entirely dependent all the year round upon Steve Smiley and his mules, because their settlement was, for postal purposes, officially tributary to the office at Mesopotamia Cross Roads. For the transaction of other business, including purchases of sundry supplies, the citizens invariably journeyed down the Tomhicken Creek so long as that unreliable stream would furnish waterway for the *Petroleum Gun*, a pigmy steamboat which plied at irregular intervals between Oil City, on the Alleghany River, and Pan Handle City.

But early in August, when Messrs Robinson and Van Horn were detailed by the Committee of which they were members to visit one or two centres of civilisation in search of a school teacher, the Tomhicken Creek was as dry as some of the old oil-wells, and Smiley's wagon afforded the only means of leaving the Valley. So the two men secured the privilege of jolting their frames for a couple of hours by the side of old Steve, and at five o'clock in the morning started upon the first stage of their journey.

Captain Peter, who had developed into an educational enthusiast, was at Smiley's stable to see his colleagues start. Taking a hand of each of them he gave them a piece of confidential and farewell advice: 'Now see here, boys. We've got a slick bang-up little schoolhouse, what's a credit to our people. What we want is a teacher to match the building. We don't want no old fogey, dried up and a-wearing glasses, and a-ketching of us all up when we make ongrammatical breaks. Nor yet we don't want no chit of a gal as is only jest out of school herself. We don't want no stuck-up piece, nor yet we don't want no dowdy female what ain't got no style about her. We want a young woman what's tolerably good-looking and smart and a lady, but one as won't mind

being one of us and making herself to home. What we want is a happy mejum—that's the word, happy mejum: a schoolmarm as'll be a credit to herself, to the young uns, to the community at large, and above all, to the School Committee.'

With which very fitting farewell ringing in their ears the travellers started out.

At Mesopotamia Cross Roads they embarked upon the regular daily coach for the ten-mile ride to Clipper Gap, whence they were able to take the railroad train to Bradford or any other of the larger towns in North-western Pennsylvania.

Messrs Van Horn and Robinson had been gone from Pan Handle City nearly two weeks, and Captain Peter Lamson, whose enthusiasm had by no means abated, was beginning to grow impatient. Not that he was disposed to criticise his absent colleagues, or willing to believe them at all dilatory, but he was very anxious to see the school started by the first day of September.

It was Saturday afternoon, and Captain Peter, arrayed in a very much soiled suit of rough blue flannel, stood with his hands in his pockets eyeing his 'pardners.' Said 'pardners' were repairing the little engine, and the Captain was 'bossing the job'; in other words, as the 'pardners' were well able to mend the engine without any 'bossing,' the Captain was simply loafing, a method of passing time which by no means suited Peter Lamson.

While the Captain watched his companions and wished for the speedy resumption of pumping operations, a man rode up on horseback. The horseman was a stranger at Pan Handle City, though not entirely strange to Lamson, who had seen him about the hotel at Mesopotamia. He seemed to remember the Captain, too, for he shouted: 'A letter for you, Cap.!'

Lamson took the proffered letter, and, with much deliberation, turned it over several times before opening the envelope. At the end of perhaps ten minutes he had deciphered the following communication: 'FRIEND CAP—We have met with suksess. She is very smart and very plesint. We will all be home this eavening. I send you this word in case you wish to make preperashuns. T. van Horn sends his riggarads, and I am rispekfully youre friend

EDWARD ROBINSON.'

'Guess you fellers can get along 'thout me?' said the Captain to his partners as he prepared to leave Well No. 4. Receiving no reply, he moved away, followed by the messenger, leading the shade of a horse.

'Hitch that there varmint,' said Lamson to the dweller in Mesopotamia, 'and come with me to my place. It's purty nigh dinner-time, and my missis 'll feed us both.'

The man was nothing loth to accept the invitation, and, after fastening the animal to a tree-stump, quickly caught up with Lamson.

'Two of the Pan Handle boys at your house?' asked Captain Peter with some curtness.

'Yes.'

'Lidy with 'em?'

'Yes.'

'Young?'

'You bet!'

'Good-looking?'

'Well, I should re-mark!'

'Look like a schoolmarm?'

'Naw!'

'Wear glasses?'

'Not much!'

'Well,' said the Captain, who began to feel both satisfied and curious at one and the same time—'Well, what *is* she, and what *isn't* she? Here, I guess you can spend a dollar when you get back home, can't you?'

'Cap.,' said the man, who was a native of the Alleghanies, 'I don't niver hev nowt to do with winimin nor females of no kind, wheerfor I ain't no jedge. But I kin tell you this yere: she ain't no slouch, that's what she *ain't*: and she's a hummer, thet's what she *is*!'

Captain Peter Lamson was a man over forty years of age. He was also a married man, blessed with a most worthy wife, whom he very much admired and esteemed. For his wife, however—at least during the years he had spent in the Valley—the Captain had never been known to shave himself on any day but Sunday, and he had not worn his 'store-clothes' since his last trip to Oil City. Yet, when the messenger from Mesopotamia had left, after partaking of a sumptuous dinner of corned beef and cabbage in Mrs Lamson's kitchen, Captain Peter carefully manipulated his favourite razor, donned a white shirt and his best suit, and then walked out to notify the other stay-at-home members of the Committee of the approaching event.

Of course the Captain was Chairman of the School Committee, and naturally deemed it eminently right and proper that he should welcome the 'schoolmarm' with some show of dignity—such, even, as a suit of black and a smooth face could lend him. Yet the question still arises, *would* Captain Peter have sought to create so favourable an impression if the messenger had not reported the new teacher to him as 'a hummer' and 'no slouch?'

It would have required a powerful stretch of the imagination to speak of a street in connection with Pan Handle City, for the shanties and small houses were dotted about with an utter disregard to anything like design. Still there was an excuse for a thoroughfare through the settlement—a sort of wagon-track, which managed to include in its course the principal wells and the steamboat landing, and which finally left 'the City' in a northerly direction to form the Mesopotamia road. It was upon this substitute for a boulevard that Captain Peter promenaded, the while he cast frequent and anxious glances in the direction of the North Mountain.

WEI-CHI: THE CHINESE GAME OF WAR.

WEI-CHI is a game which holds an absolutely unique position. It is the only pastime in the world which stamps its devotees as men of mark and learning, the only one which requires such exercise of perseverance and application of its results as to guarantee the possession of high intellectual powers on the part of those who indulge in it. Considerable brain-power is no doubt demanded by whist or chess; but either of these games can be played after a fashion by

people who are anything but clever. Wei-ch'i differs from them and from all other games of skill or chance in the fact that it is so difficult of acquirement as to debar any but persons of a high order of intelligence from gaining more than the most elementary knowledge of it. The toiler cannot hope to be able to devote sufficient time to this difficult game to enable him to excel in it; its acquirement is reserved for the man of leisure, who can apply himself seriously to the solving of its mysteries. And so Wei-ch'i is the game of the higher classes of Chinese society; the masses cannot expect to attain to a knowledge of its intricacies. There is no likelihood of the careless or impatient man becoming a Wei-ch'i player. The game presents complications which could never be mastered by the careless, and requires an expenditure of time that would infallibly prove too much for the impatient. Speaking in a general way, it may be said that only the cream of the vast population of the Celestial Empire are Wei-ch'i players; and even among the highest in the land many are to be found who have never succeeded in mastering this intricate amusement, if, indeed, any such intellectual exercise can be called by so frivolous a name.

To play Wei-ch'i, and if possible play it well, is the very summit of the ambition of hundreds of Chinamen. They struggle over the board day after day and week after week, fighting against the feeling of despair that must creep over every one who attempts to conquer the rules of the game, until at last the crooked paths look straight to them, the mysteries resolve themselves into a shape that can be understood, and they are victorious. It is a proud moment in the life of a Chinaman when he can with truth call himself a Wei-ch'i player. The knowledge of his acquaintance with the famous game makes him feel that he is a personage of some importance, and he looks down in a pitying way upon those of his friends who either cannot or will not place themselves in a position to meet him over the many-squared board.

Wei-ch'i is played on a magnified chessboard containing eighteen squares along each side, or three hundred and twenty-four in all. The men are usually made of marble, and are shaped like those with which we play draughts. As in the latter game, they are coloured black and white; but, unlike draughtsmen, they do not move from one square of the board to another. The players alternately place one of their men upon the board. Once a Wei-ch'i man has been put down, it must remain where it is placed; that is to say, on one of the points formed by the intersection of any two lines of the board. The squares are not taken into consideration at all. The game is played upon the points to which we have just alluded, and which in a board containing three hundred and twenty-four squares number three hundred and sixty-one. The points on the outside lines of the board where other lines end, are brought into play

in just the same manner as those inside. The size of the board is not arbitrary. As we have said, the game is properly played upon one formed by nineteen lines intersecting nineteen others, and thus forming a square which contains three hundred and twenty-four little squares like those of a chessboard. A smaller board than this may, however, be used, and to simplify our illustration of this brief description of Wei-ch'i, we have chosen one containing but ten squares on each side. A smaller board than this could hardly be employed; one of any size between this and the full dimensions may be chosen, always provided that the number of squares on each of its sides is an even one. In a game played on a full-sized board about three hundred men are used. From ninety to ninety-five will therefore be required for a game on our smaller board.

The aim of the Wei-ch'i player is to surround with his men as many of the intersecting points which the board comprises as he can. The following diagram shows a few examples which will illustrate our meaning, and assist the reader to obtain some grasp of this intricate subject:

Fig. A illustrates the case of a black man which is surrounded by four white ones. The point occupied by black becomes white's property on his managing to surround it in this manner, and he therefore takes the black man off the board. But though white has thus secured a point, there is no reason why he should remain in undisturbed possession of it. Black may surround his four men with eight others, placing one on each of the immediately neighbouring points. It then only remains for him to put down another man on the central point, and white is in turn hemmed in, with the result that his four men may be taken up, the points occupied by them becoming black's property.

Fig. B shows a better position than that occupied in fig. A. When black has his men disposed in such a manner, there is no great likelihood of white's being able to do much against him in this particular case.

In fig. C, white has managed to secure an impregnable position. He has surrounded two points entirely, and black is unable to surround him in

turn, as to do this both of the spaces now belonging to white must be filled. This can never be done in such an instance as we have under consideration, for a man must not be placed among the enemy's men unless the latter can be taken up then and there. One of the two spaces which white has enclosed in fig. C must always remain open; and so white may look upon himself as the gainer of two points if he manages to secure such a position as we have indicated. Of course this and other examples which we give here are not very likely to ever occur in a real game, at all events in such a simple form; for the sake of illustration it is imagined that the men surrounding any particular point have been allowed to take up the positions marked without any hindrance on the part of their opponents.

Fig. D shows a white man occupying a point along one of the boundary lines. Three black men only are required to enclose him, and if they are placed in the positions shown, the white man may be taken up, with the result that black becomes the owner of the point it occupied.

Two men only are required to capture a corner point, as is demonstrated in fig. E.

In fig. F we have a similarly impregnable position to that shown in fig. C, only in the case of fig. F two more men are required than in that of fig. C, as the points surrounded are in the middle of one of the sides of the board. When a player threatens to take up one of his opponent's men he calls 'I'll eat you,' in the same way as chess-players cry 'Check' when they menace the opposing king.

The Chinese attribute the invention of their game to Yao, one of their most famous emperors, who ruled over them more than four thousand years ago. Whatever may be the truth of this assertion, there is no question that Wei-ch'i has flourished among the Celestials for an immense time. Some of their writers who lived before the Christian era alluded to it in a manner which shows that it was then of great antiquity.

A game goes on until neither player can put down a man without either placing it on a point belonging to his opponent, where it will be at once taken up, or filling with it uselessly a space which belongs to him already. When this stage is reached, it only remains to count the points enclosed by the men of either player; whichever has succeeded in surrounding the greater number is the winner. There is no possibility of a drawn game, for as the board contains an uneven number of points, there must always be one left to fight over.

Probably, there is no game in the world more difficult of explanation than Wei-ch'i. But because it seems hard to grasp the theory of the pastime from this necessarily brief *résumé* of it, the reader must not imagine that it is a game leading to more weariness than amusement. Not one Briton in a hundred, nay, in a thousand, would have the patience to make himself fully master of its intricacies; but it is only necessary to see the rapt attention paid to it by the cleverest men of the Flowery Land in order to realise the fact that it must be a game possessing great merit. If any proof of this assertion is required, we have it in the far greater attention paid to Wei-ch'i than to any other game by the more intellectual Chinese. It is not that they are without other

games, and so take to this one for want of a better. Chess, dominoes, a variety of card-games, and many others, are known to Chinamen, but none can dispute the supremacy of Wei-ch'i.

THE WOOING OF ALPHONSE.

MONSIEUR ALPHONSE THÉVINET was sitting with his arms upon one of the small iron tables under the awning outside the *Café Victor* on the Cours Boileau. A glass of cold coffee stood before him, which he stirred now and again with an abstracted air. The buzz of conversation, the excited exclamations of piquet players, and the rattle of dominoes, rose all round him; waiters in long white aprons fitted to and fro, laden with cups and glasses, serving the numerous customers who made the *Victor* their nightly rendezvous. It was eight o'clock on a warm July evening, and the company at the café was large; but M. Alphonse Thévinet, sitting alone, buried in his thoughts, saw and heard nothing. For M. Alphonse was in love! Yes, in love. He had become deeply *épris* with Mademoiselle Adrienne Mesnildot, daughter of the rich advocate, M. Jules Mesnildot, and the belle of Rouen.

How he had succeeded in falling in love with her is a question too subtle for us to deal with. He had never waltzed with Mademoiselle Adrienne; had never sat out dances with her in twilight bowers; had never even taken her down to dinner or played tennis with her. The last was indeed an impossibility, for lawn-tennis was a closed book to M. Alphonse. He had that afternoon met Madame Mesnildot and her only daughter at the band in the gardens at the Place Solferino, and had, as on previous occasions, sat with them, criticising the music and the passers-by, talking of the weather, the approaching festivities of La Fête Nationale, and the news from Paris. It was the ninth time he had thus met Mademoiselle Adrienne; but never in the whole course of his acquaintance had he enjoyed so much as a two minutes' tête-à-tête with her. Madame her mother was her constant duenna, and little walks and little talks with Mademoiselle by herself were luxuries unknown to him. And yet at the moment we find him lounging over his *café froid* at the *Victor* he is actually engaged in the process called 'making up his mind' to propose in due form for Mademoiselle Adrienne's hand. 'She is beautiful,' said M. Alphonse to himself; 'she is amiable; she is nineteen years old; and Monsieur Mesnildot cannot give her less than eighty thousand francs for *dot*. Less! *Parbleu*, it is impossible that she shall not receive one hundred thousand. My friend Monsieur Jules Bernier shall call upon Madame Mesnildot without delay. It is done!'

Now, it was a somewhat bold thing for M. Alphonse to say thus that 'it was done,' inasmuch as M. Georges Thévinet, his father, had never even told him to look upon himself as affianced to Mademoiselle Adrienne or anybody else. But allowance must be made for M. Alphonse in view of the singularly happy attitude his only living parent adopted towards him. M. Georges Thévinet was a shipowner of large property; and of his three children, M. Alphonse was the eldest and his favourite; to Alphonse he gave an annual allowance of six thousand francs, and

denied him nothing he chose to ask. When, in accordance with the laws of the Republic, M. Georges' wealth was divided amongst his three sons, the share he had allotted to Alphonse, though apparently of value equal to those of his brothers, would in reality yield the largest income.—But we anticipate.

M. Alphonse Thévinet, sitting over his cold coffee at the *Victor* was one of the best-looking young men in all Normandy, and everybody, himself included, knew well that he was the best *parti* in the province. He was twenty-eight years of age, and stood five feet two inches in his socks; his black hair, cut scrupulously to a uniform length of three-eighths of an inch, stood erect upon a well-shaped head; his moustache, though small, was a model of symmetry; and his dress, from the high-crowned straw hat with ribbon 'à la Tour Eiffel,' to his varnished boots, defied criticism. Mademoiselle Adrienne was fortunate indeed; Monsieur and Madame Mesnildot could not but welcome such a suitor for their daughter; and since M. Alphonse had decided to present himself in that capacity, her happiness was secured whether her views concurred with theirs or not. A young French lady has no voice in these matters; she is not consulted, and infinite possibilities of trouble are thus agreeably avoided.

M. Alphonse sat smoking his cigarette and tasting his coffee, now and then exchanging a bow with an acquaintance; but he made no attempt to enter into conversation, until a short stout man of five or six and thirty, with a smooth pleasant face, came through the flower-tubs which partially concealed the café doors from the public eye. Then M. Alphonse sprang up to meet him.

'Aha! it is you, my friend,' he cried. 'Come! sit here with me. I have business of importance to discuss.'

M. Jules Bernier—for he, and no other, was the newcomer thus welcomed by Alphonse—suffered himself to be led to a seat at the table whence the latter had just risen.

'You will take something?' inquired M. Alphonse affectionately.

'A glass of *eau sucrée*,' responded M. Jules Bernier with promptitude.

The refreshment was speedily placed before him; and as he proceeded to break the sugar in his glass with the metal crusher, he reverted to the words with which his friend had greeted him. 'You have business of which to speak,' he said. 'May I inquire its nature?'

M. Alphonse threw aside the end of his cigarette and leaned across the table, that he might not be overheard. 'You know, doubtless, Monsieur and Madame Mesnildot, Jules, my friend?' he began.

M. Bernier sipped his glass with relish and bowed assent. 'Yes,' he said; 'I have known them well from my childhood.'

'You are then an intimate friend?'

'Certainly; I have the honour.'

'Then I have to ask of you a favour, Jules,' said M. Alphonse impressively. 'I wish to ask if you will accept from me an errand of delicate nature to Madame Mesnildot?'

'Aha, Alphonse!' and M. Bernier looked encyclopædias at that gentleman. 'You refer without doubt to Mademoiselle Adrienne? Is it not so?' M. Bernier might have been guilty of winking, as he put this question, had he known how to

do it; but he did not, so he accompanied it by raising his eyebrows until they vanished into his hair, which answered the same purpose.

'You are right, my friend,' responded M. Alphonse. 'I am *épris* with Mademoiselle Adrienne.' He did not blush as he made the tender confession; he had fallen in love on his own responsibility, and his independent spirit scorned a blush.

'And you wish me to acquaint Madame Mesnildot with your feelings?'

'If I may so far task your friendship.'

'You may, Alphonse. Monsieur your father has signified his consent, no doubt?'

'Why, no! He is'—

'He has *not* done so!' exclaimed M. Bernier in tones of horror. 'You cannot possibly ask me to do this, when Monsieur Thévinet has not given his permission?'

'Listen to me, Jules, my friend, I pray. My father has ever been to me the most indulgent of parents, and as he is presently travelling in the country, I feel assured that I may take his permission as given.'

M. Bernier shook his head. 'Do I understand that Monsieur your father is as yet unaware of your intentions? Nay! I cannot say intentions; your wishes?' The revelation of Alphonse had stunned M. Bernier.

'I repeat, Jules, that I am so sure of receiving his consent, that I ask you to approach Madame Mesnildot without delay. Will you perform this kind office for me?'

'As you will,' answered M. Bernier, drawing in his wrists and elbows and expanding his palms, with a shrug of the shoulders—'as you will. For my part, I am happy to serve you.'

'Then, if you will take breakfast with me at twelve o'clock on Saturday, I will give you all particulars to satisfy Madame Mesnildot.'

'So soon, Alphonse?'

'Ah, Jules, do not suggest a later day! Will your convenience permit that you call upon Madame Mesnildot on Saturday?'

M. Bernier had by no means recovered from the shock of hearing that M. Georges Thévinet was unacquainted with his son's intentions; but on reflection, he decided that Alphonse was the best judge of his own affairs, and that no responsibility would fall upon himself by accepting the post of ambassador. He therefore replied that it would give him pleasure to breakfast with his friend at mid-day on Saturday, and that he would call upon Madame Mesnildot afterwards.

M. Alphonse embraced him with fervour, paid for their refreshment, and left the café to walk homewards.

M. Jules Bernier was a man of his word, and punctually at noon on the appointed day he arrived at M. Thévinet's house carefully arrayed in evening dress in readiness to pay his formal call on Madame Mesnildot immediately after breakfast.

Little passed between the friends during the meal, though they were alone together. M. Bernier was busy with his knife and fork, and though Alphonse ate sparingly, his thoughts kept him silent. No qualms of doubt as to the precipitancy of the step he was about to take—by deputy—oppressed him. His faith in his father's affection and generosity was too deeply rooted

to be disturbed by his ungiven consent. But at times he was conscious of a mad yearning to follow the bold unseemly custom he had been told was prevalent among the people of Great Britain, to go in person to Mademoiselle Adrienne's mother, and flinging himself on his knees at her feet, implore her to give him her daughter's hand. But of course such an extraordinary proceeding was quite out of the question. Conventional usage, born of modesty, dictated that the principal should sit quietly at home, while a trusted family friend conveyed the weighty petition to the beloved object's mother. Alphonse had never heard that there are cases on record in which a young Englishman has taken upon him to address the girl of his choice herself without ever consulting the parents on either side at all; and if he had, he would not have believed it, even of Britons. The idea of doing such a thing never crossed his mind.

'You have, I hope, made a good breakfast?' he said to M. Jules as his friend drew the napkin from his collar with a sigh of content.

'Excellent; I thank you,' replied M. Bernier. 'With your permission, I will light a cigarette, and you can inform me regarding your pecuniary position, that I may explain it to Madame Mesnildot.'

Keeping carefully in mind that he had taken his father's consent for granted, Alphonse instructed his friend to say that his allowance when he married would be twelve thousand francs per annum, and that he expected to inherit not less than half a million of francs at his parent's death. He had nothing else to say, except that a life's devotion would be Mademoiselle Adrienne's, and he should be glad to learn whether her *dot* was not to be one hundred and fifty thousand francs, and the furnished house on the Boulevard Cauchoise.

M. Jules Bernier elevated his expressive eyebrows as he heard this. 'One hundred and fifty thousand francs, and that beautiful house—furnished, *parbleu!*—on the Boulevard, is much to expect Alphonse, my friend,' he said.

'Nevertheless, you will say that, if you please,' replied Alphonse. 'It was a matter of business; and Alphonse was no child.'

'As you wish,' answered M. Bernier with a shrug, as he rose from his chair and adjusted his cravat at the mirror. 'It is now half-past one o'clock. I will go to Madame Mesnildot's, and return direct to you here, at perhaps three o'clock.'

'I will await you in the *salon*,' said Alphonse with dignity, and he followed his friend to the door.

We need not dwell upon the suspense of M. Alphonse Thévinet, or upon the eagerness with which he received his ambassador when he re-appeared two hours later.

'You were long gone,' he said breathlessly. 'But do not delay; tell me Madame Mesnildot's reply.'

'Her reply,' answered M. Bernier, with the smile of one who loves to bring good news, 'is, *Yes*. She assured me that Mademoiselle would be overwhelmed with gratitude for her good fortune, and that her *dot* would not be less than one hundred thousand francs.'

'And the furnished house?' queried Alphonse.

'Madame said nothing of the house,' answered M. Bernier. M. Bernier had done this kind of office before, and knew better than to drive bargains at the first interview.

A cloud gathered upon the brow of Alphonse. He had persuaded himself that M. and Madame Mesnildot would have promised all he chose to ask, and he had demanded thus much, that he might make assurance doubly sure when he came to request his father's permission to marry Mademoiselle Adrienne. He was disappointed.

'A hundred thousand is a small *dot* for Monsieur Mesnildot to give his only daughter,' he said.

'I would counsel you to let that side of the matter remain for settlement between Monsieur your father and the parents of Mademoiselle,' replied M. Bernier.—'When does Monsieur Thévinet return to Rouen?'

Alphonse could not tell for certain. He was travelling in the country near Bordeaux, and had no fixed address at present; but he expected him to return at the end of the month.

'Well, I will offer you my congratulations, and take my leave for to-day,' said M. Bernier. 'It has given me great pleasure to have had the honour of conveying your message to Madame Mesnildot.'

Alphonse hastened to express his gratitude for the service his friend had done him; the indebtedness, he said with sincerity, was all on his side. Without Jules, he had been quite at a loss to address Madame Mesnildot; thanks could not repay M. Bernier for what he had that day performed. He kissed Jules upon both cheeks as he bade him adieu, and having seen him depart, threw himself into a chair to dream of Mademoiselle Adrienne.

Two weeks later, M. Georges Thévinet returned home from his travels, and was received with effusion by his son.

'I have news for thee, Alphonse,' said the old gentleman as they entered the *salon* arm-in-arm.

'And I for thee, also,' replied his son. 'But first of all, give me yours.'

M. Georges Thévinet beamed upon Alphonse with paternal pride as he answered in impressive tones: 'I have found for my son a wife. I promised my friend Monsieur Laguerre that you shall espouse his daughter Mademoiselle Clarisse.'

'Mademoiselle Clarisse!' exclaimed Alphonse. 'Sir, she is forty.'

'She is but thirty-eight,' replied his father in correction.

'She has a squint,' said the son.

'She has Seven Hundred and Fifty Thousand Francs,' said the father, fixing upon Alphonse a look in which affection and cupidity were happily blended.

'It matters nothing,' cried Alphonse; 'for I love another.'

'Eh! What's that?' inquired old M. Thévinet, who was a little hard of hearing.

'But two weeks since, I received Madame Mesnildot's sanction to marry Mademoiselle Adrienne.'

'Then you must write and apologise for your mistake. I have already told you that you are

affianced to Mademoiselle Clarisse Laguerre, replied M. Thévinet firmly.

'Never!' cried Alphonse with a gesture of despair.

'But you are. I absolutely refuse to sanction your marriage to any one else. Mademoiselle Mesnildot will not receive one-third—mark me, boy!—not one-third of the *dot* with which Monsieur Laguerre will endow his daughter.'

'I care nothing for the *dot*,' cried Alphonse wildly. ('The boy is mad!' muttered M. Thévinet, senior.) 'I will marry no one but Adrienne, A-dri-enne.' And at this point the feelings of Alphonse overcame him and he sobbed.

Coercion, diplomacy, and persuasion were tried by M. Thévinet in turn with barren results; and finally there ensued a quarrel so violent that Alphonse packed up his portmanteau and left the house.

'To think of the boy's contracting a matrimonial engagement without a word to me!' said M. Thévinet to himself as he retired that night. 'What on earth can have got into his head? What is the world coming to?'

'To think of my father giving away my hand like that!' said Alphonse as he strode down the Boulevard. 'I might as well be a Turkish slave at once!'

Fortunately, Alphonse had plenty of money in his pocket, and he had soon installed himself in pleasant lodgings in the Boulevard Jeanne d'Arc. 'It is indeed lucky,' he said to himself as he unpacked his clothes, 'that I am over twenty-five years of age. Were I but a few years younger, the course I must pursue, repugnant as it is to my filial feelings, would be closed to me.'

Alphonse had already decided to take such steps as would render his marriage without his father's consent a legal union, though he shrank from the process, and chafed at the delay it would entail. Had he been under the age of twenty-five, his father's refusal would have bound him hopelessly, according to law. The *procès-verbal* is a legal weapon denied young men below that age. But Alphonse, as we have already remarked, was twenty-eight, and he knew the power the law conferred upon him.

'I wish I had been an Englishman,' he said to M. Jules Bernier one evening a week later at the café.

'Why so?' asked M. Bernier.

'Could I not then marry Adrienne at once without my father's consent?' asked Alphonse.

'Certainly you might,' replied M. Bernier. 'But were you an Englishman, you would have other things to consider, my friend. The lady might decline to marry you; and Monsieur your father might exercise the brutal privilege of an Englishman, and "cut you off with a shilling."—No, no, Alphonse; be thankful that you are a citizen of the Republic.'

But Alphonse did not feel thankful or pretend to be so; he said in meaning tones: 'I yesterday took the first step.'

'You do not mean to say'—The rest of M. Bernier's speech was spoken in an awe-struck whisper.

Alphonse pressed his lips together and answered: 'I did.'

It was true. On the morning of the previous day, a gentleman who pursued an honourable

calling analogous to that of sheriff-officer, had waited upon M. Georges Thévinet with a document of portentous size in his hand, and demanded audience of that gentleman in the name of the Law.

'What have you there?' M. Thévinet inquired of this official as he produced his paper.

'It is the *procès-verbal*, Monsieur. On behalf of your son, Monsieur Alphonse Thévinet, do you consent to his marriage with Mademoiselle Adrienne Mesnildot?'

'No, I don't!' replied M. Thévinet with much asperity.

The legal gentleman requested that he might be furnished with a pen; and having received it, wrote down M. Thévinet's answer with great care upon the document. 'I have the honour to bid you respectfully adieu, Monsieur,' he said as he rolled up the paper and put it under his arm. 'It will be my duty to call upon you once more in a month's time.'

'I fear you will have the trouble of calling also a third time,' said M. Thévinet, forcing himself to be calm. 'Is it not so?'

The polite official shrugged his shoulders in deprecation. 'If Monsieur did not give his valued consent the second time the *procès-verbal* was presented,' he said, 'doubtless it would be the wish of M. Alphonse to have it presented two months hence for the third time.'

'And then?' inquired M. Thévinet, who knew all about it, but was anxious for fuel to feed his wrath.

'Why, then, if Monsieur withheld his permission on being asked a third time, M. Alphonse would be legally able to marry without.' The polite official made a profound bow and hastily withdrew. M. Thévinet's anger had mastered him, and he appeared about to vent it upon his visitor.

Had M. Thévinet been an Englishman with an Englishman's power over his own property, he would most inevitably have sent for his solicitor and altered his will that day. But he could not; a French parent's estate is, irrespective of his wishes, divided by the law amongst his children or heirs at his demise; so M. Thévinet could not enjoy that remote satisfaction. However, he did the next best thing. He wrote to Alphonse, and told him that until he returned to his roof, penitent and prepared to marry Mademoiselle Laguerre, he should give him only the barest pittance upon which to exist. 'If you think,' wrote the indignant father, 'that Monsieur and Madame Mesnildot will accept a penniless suitor for their daughter, the legal steps you have taken to set the necessity for obtaining my consent aside, will have served their end. But I doubt whether in your new position you will receive the welcome which they accorded your representative, M. Bernier. I should advise you to think this over at your leisure.'

When Alphonse received this letter, he recognised the weakness of his case, and proposed a compromise. If his father would not call upon him to marry Mademoiselle Laguerre for three years, he on his part would renounce his intention of marrying Mademoiselle Mesnildot. Would M. Thévinet receive his sorrowing son upon these terms?

The language in which the old gentleman indulged when his son's answer reached him was

dreadful to hear. He would agree to no conditions whatever, and Alphonse might take his choice—Mademoiselle Clarisse, or poverty in solitude until the end of his father's lifetime. He wrote at once directing his son to choose, reminding him that this was the sole favour he had ever asked in return for all he had done for him. It was a powerful and pathetic letter; the heart of Alphonse was touched by it, and he gave way. After a bitter struggle with self, he made up his mind to obey his father; he sent the sheriff-officer his fee, and directed him not to serve the *procès-verbal* again; repacked his portmanteau, and went home in a cab.

How old M. Thévinet called upon Madame Mesnildot and explained that M. Jules Bernier's visit had been paid under a misapprehension; and how Madame Mesnildot said she was sorry, but that it didn't matter, because she had not mentioned the subject to Adrienne yet, it boots not to tell. We have only to conclude the history of the wooing of Alphonse by the bare statement that his father took him down to Bordeaux a month afterwards, stood over him while he agreed to the *promesse de mariage* which Monsieur le Notaire had prepared, and saw him épouse Mademoiselle Clarisse Laguerre at the *bureau* of Monsieur le Maire. Mademoiselle Clarisse promises to be a model wife in all respects, and everybody is contented and happy.

IS OUR CLIMATE CHANGING?

THE question whether the present climate is constant is one much discussed by scientists. While with meteorologists the constancy of our climate is to a certain extent an axiom, geologists, geographers, and hydrographers beg to differ. The controversy was brought before the meeting of German geographers recently held at Berlin, in a paper prepared by Professor Brückner, of Bern. Dr Brückner, on the whole, leans to the side of the geographers, who hold that a change of climate has been observed within historic times; and he substantiates their views by a powerful array of facts. All scientists are agreed as to a change of climate from the Tertiary to the Glacial period, and from the latter to the present day; but, as observed, the difference of opinion begins with historic times.

The dispute between the two parties entered upon a new phase when the meteorological material regarding the changes of temperature within longer periods was begun to be examined. The fluctuations in the glaciers of the Alps seem to point towards a variation of the climate. The changes in the mass of Alpine glaciers are governed by rainy and cold, as well as by dry and warm, periods. A similar variation in those periods is shown by hydrographic observations on the Black Sea, the Caspian, and the Baltic, which agree with periods of high or low water levels. Meteorological observations which have been taken at six hundred meteorological and hydrographic stations by many thousands of observers, present us with a picture of the fluctuations of climate on the whole earth. Those observations have determined the changes of rainfall from Scotland over Central Europe to the eastern shores of the Old World and in America. We learn from the curves, taken

that, in the present century, much rain fell during the twenty years 1840-60, that the succeeding decade (1860-70) was dry, and that the next (1870-80) was wet. Although the maxima and minima of those periods were not absolutely equal, the curves show that no maximum fell in a minimum territory, or that the contrary took place. Exempt from this general rule were only a few territories, such as Lower Italy, Sicily, Southern Spain, and the east coast of America, which are influenced by the Atlantic Ocean. The fluctuations became more accentuated the farther they penetrated into the interior of the Continent. Besides the length of time during which rivers are frozen over, the direct curves of temperature of the several years supply further material for the changes of climate; and in this direction it is found that the fluctuations in the curves of the temperature coincide with those of the rainfall. Those fluctuations may be followed as far back as the last century; for Russia, back to 1700; and for the Caspian Sea, even as far back as 1685. Most interesting and confirming results are supplied by the registers kept of the time of the wine-harvests in France and Switzerland, which are more numerous after the year 1500; the records of one nation thus acting as a check upon those of the other. In cool and damp years the grape ripens later, in warm and dry seasons earlier. Those changes coincide with great fluctuations of temperature.

If we now inquire into the final cause of those changes and fluctuations, an explanation is supplied in the case of the rainfall by the conditions of the air-currents and their variations, which are again dependent upon air-pressure. In dry periods the pressure is greater on land, and rises to high pressure; while its diminution in wet years permits the sea to exert a greater influence by its cooling and fructifying action. Independently of the interest with which those problems of nature are followed by scientists, fluctuations of climate are of profound practical importance; for times of famine and plenty, of depression and prosperity in trade and industry, are dependent on and regulated by the rising and falling of rivers and lakes, and the dearth and abundance of rain or sunshine.

R O N D E L.

SHE came to me when Spring was in the land;
I could not separate her from its flowers;
She was inwoven with the budding hours
When Summer's dainty leafery is planned.

We stood a day or two on Friendship's strand,
As rightly met as April sun and showers:
She came to me when Spring was in the land;
I could not separate her from its flowers.

And though we go not hence linked hand in hand,
Nor as a gentle friend my life she dowers,
Lent-lilies will recall those rides of ours;
I'll say, when primroses their buds expand:
'She came to me when Spring was in the land.'

WORKING-HOURS ABROAD.

THERE has been of late so much agitation and discussion as to what does, and what does not, constitute a fair day's work, that the Reports of Her Majesty's representatives abroad, with respect to the hours of labour in Europe and the United States, come to hand very opportunely, and afford convenient means of comparison with the hours of labour that prevail among ourselves.

So far as regards laws regulating the number of hours a man shall work, the great majority of our representatives in foreign lands have the same story to tell—that such laws are non-existent. Of the different states forming the Empire of Germany, none have any special enactments on the subject, the Imperial legislature alone being competent to deal with it, and that body has left adult labour entirely unfettered, except in forbidding the employment of women in certain kinds of work, and enacting that employers may not compel their workmen to ply their vocations upon Sundays or feast-days, only where the special nature of an industry precludes the work being postponed or interrupted. In 1886 the Belgian Labour Commission pronounced against any legislative interference with the freedom of working-men. Neither in Sweden, Denmark, the Netherlands, Spain, Portugal, Russia, Italy, Greece, nor Turkey has the idea of fixing the limits of a working-day by law been entertained; while the Roumanians, Bulgarians, Servians, and Montenegrins, if they agree in nothing else, are of one mind as to leaving masters and men to make such arrangements as they deem best for their interests.

• Very little information is vouchsafed as to the actual working-hours in the countries where freedom of contract remains unchallenged; but we are not left quite in the dark. We learn that a Turkish working-day lasts from sunrise to sunset, with certain intervals for refreshment and repose. In Montenegro the day-labourer begins work between five and six in the morning, knocks off at eight for half an hour, works on

till noon, rests until two, and then labours on until sunset. This is in summer. In winter, he commences working at half-past seven or eight, rests from twelve to one, and works uninterruptedly from that time to sunset. The rules respecting skilled labour are theoretically the same, but considerable laxity prevails in practice. In Servia the principle of individual convenience rules in every case. In Portugal from sunrise to sunset is the usual length of the working-day. With field-labourers and workmen in the building trade the summer working-day begins at half-past four or five in the morning and ends at seven in the evening, two to three hours' rest being taken in the middle of the day. In winter the hours are from half-past seven to five, with a shorter interval of repose. In manufactories the rule is twelve hours in summer and ten in winter, with an hour and a half allowed for meals.

Eleven hours is the average day's labour in Belgium; but brewers' men work from ten to seventeen hours; brickmakers, sixteen; the cabinetmakers of Brussels and Ghent are often at work seventeen hours a day; tramway drivers are on duty from fifteen to seventeen hours, with an hour and a half off at noon; railway guards sometimes know what it is to work nineteen and a half hours at a stretch; and in the mining districts women are often kept at truck-loading and similar heavy labour for thirteen or fourteen hours.

The normal work-day throughout Saxony is thirteen hours, with two hours' allowance for meal-taking. In Baden the medium duration of labour is from ten to twelve hours; but in some cases it far exceeds this, often rising to fifteen hours in stoneware and china works and cotton mills; in sawmills to seventeen hours; while the workers in the sugar-refineries, where the shift-system is in vogue, work for twenty-four hours, and then have twenty-four hours free; and in so many of the Baden factories Sunday-work is the rule. In Russian industrial establishments, the difference in the working-hours is something extraordinary, varying from six to twenty. 'It

is remarkable that these great divergences occur in the same branches of industry within the same inspector's district, and among establishments whose produce realises the same market price.'

The only European states in which the law controls, or pretends to control, the disposal of a grown man or woman's time are Austria, Switzerland, and France. In the first-named, the factory hand must not work more than eleven hours a day, exclusive of an hour and a half for refreshment and recuperation; and in mines the actual working shift is limited to ten hours; but these rules are liable to modification with the joint consent of the Minister of the Interior and the Minister of Commerce; while in special cases the Industrial Officer of the district is empowered to permit a temporary increase in the working-hours for a period of three weeks or less. A permanent extension of time has for some reason been given by ministerial ordinance to spinning-mills and silk factories, by which the hours of labour have been lengthened to twelve and thirteen hours respectively.

In Switzerland, a normal working-day must not exceed eleven hours, with one hour's interval, comprised between the hours of five A.M. and eight P.M. during the months of June, July, and August; and between six A.M. and eight P.M. during the remainder of the year, the time to be regulated by the town-clock. On Saturdays and holidays the workshops must be closed two hours earlier. Exceptional and temporary prolongation of the working-time is obtainable in cases of necessity, 'but not simply to suit the convenience of the employer.' Sunday labour, except where it is absolutely necessary, is prohibited altogether; and under no circumstances is feminine labour permissible on that day. On ordinary days any woman having a household to look after is free to leave the shop one half-hour before the mid-day rest.

The hours of adult labour in France are regulated by a series of decrees, the earliest of which, promulgated in 1848, enacted that the working-man's day in manufactories and mills shall not exceed twelve hours of 'effective labour.' In 1851 another decree exempted certain occupations from the limitation; and in 1885 it was officially laid down that the twelve hours' limit was confined to such manufactories and mills as were moved by machinery by day, or machinery in motion by day and night without extinction of fires; and that no workshops employing less than twenty-one hands in any one shed came under the law of 1848. Of the six or seven million people earning daily wages in France, not more than a million are computed to be subject to the provisions of that law; indeed, the Inspectors of Factories only record three hundred and fifty-nine thousand adults, of whom forty-one per cent. are women; and it may be accepted that Frenchmen in factories pass at least fourteen out of every twenty-four hours in the factory; while the

workers outside, such as carpenters, masons, and labourers, work for any number of hours inclination may prompt or necessity compel.

The United States are by no means united on the subject of labour legislation. Most of them are content to leave it alone. New York pronounces eight hours a legal day's work for all classes of mechanics, working-men, and labourers—excepting those engaged in farm and domestic labour, or in the operation of street surface or elevated railroads within the limit of cities of more than a hundred thousand inhabitants; ten hours' labour within twelve consecutive hours, with a reasonable time for meals, constituting a day's work with the last mentioned. Connecticut, Pennsylvania, California, and Indiana reckon the legal working-day at eight hours; in Michigan, Rhode Island, Maine, Florida, and Maryland it is two hours longer; but the clauses in all enactments of the kind contain the distinctive proviso, 'unless otherwise agreed;' an addendum which doubtless owes its being to the fact that by the American Constitution the several States are prohibited from passing any laws impairing the obligation of contracts. Law or no law, it comes to the same thing with those concerned. As everywhere else, so in America, the length of a working-day varies in different trades and callings, ranging from eight to sixteen hours; but as a general rule, ten hours is the working-day of the United States.

As will be seen from the above statistics, the position of our workmen at home may compare favourably with that of workmen abroad. Of course this remark does not apply to special classes of our workmen, such as those who serve the needs of the travelling public, and whose hours are in many cases unquestionably too long. The skilled artisan at home, as well as the agricultural labourer, appear, however, when compared with their contemporaries on the Continent and in the States, to be in a much better position as regards hours of labour.

A DEAD RECKONING.

CHAPTER XVII.

FOR the first few moments after Picot's startling confession had fallen like a thunderbolt among those assembled in the justice-room of Cumberhays, the silence was so intense that, to use a common phrase, a pin might have been heard to drop. Every eye was focussed on the mountebank, who stood on the spot where he had risen, erect and very pale, his eyes glowing in their deep orbits like live coals, and pressing his soft felt hat with both hands to his breast. Suddenly there was a slight commotion close to where the magistrates were sitting; the strained silence was broken, and all eyes turned as with one accord. The lady in black, she who was said to be the wife of the accused man, had fainted. But Margery's strong arms had caught her ere she fell. Another woman in the body of the court at once hurried to her help, and between them the unconscious young wife was carried out.

'Place that man in the dock,' said the red-faced magistrate, 'and allow the other prisoner to be seated.'

Picot stepped quietly forward of his own accord, the people near making way for him with wonderful alacrity, and placed himself on the spot the magistrate had indicated, a couple of constables stationing themselves behind him as he did so. Then the clerk put certain questions to him, which Picot answered without a moment's hesitation. When these came to an end the entry on the charge-sheet stood as follows: 'Jules Picot. Age, forty-three. Native of France. Profession, acrobat. No fixed place of residence.'

Then the magistrate, clasping the fingers of one hand in those of the other, and resting them on the table in front of him as he leaned forward a little, said: 'Jules Picot, you have confessed openly and in public to the commission of a most heinous and terrible crime. Such being the case, we have no option but to detain you in custody while inquiries are being made as to the truth or falsehood of the extraordinary statement just volunteered by you. Any further statement you may choose to make we will of course listen to; but at the same time we must caution you that anything you may say will be taken down and used as evidence against you elsewhere. Is it your wish to make any further statement, or is it not?'

'Ma foi, monsieur,' answered Picot, with a slight shrug, 'that is what I am here for—to make what you call statements, to tell the truth, to prove that this gentleman is innocent, and that I, Jules Picot, and I alone, killed Otto von Rosenberg.' He paused, and in the hush that followed, the rapid scratching of the clerk's pen as it raced over the paper was clearly audible. The pencils of the two reporters who sat in a little box below the clerk moved at a more deliberate pace. One of them even found time to make a furtive sketch of Picot on a blank page of his note-book.

It was so evident the prisoner had something more to say that no one broke the silence.

'Eight years ago, monsieur,' he began in a low clear voice, 'I had a wife, a daughter, and a son. Now I am alone. I was living in Paris. No man could have been more happy than I was. Stephanie, my daughter, had an engagement at the Cirque de l'Hiver. She was beautiful, she was good. In an evil hour she attracted the attention of the Baron von Rosenberg. He followed her everywhere; he gave her rich presents; he even went so far as to promise to make her his wife—*scellé* that he was! Of all this I knew nothing till afterwards. One day Stephanie does not come home. I make inquiry for her. She has fled. Von Rosenberg, too, has disappeared. They have fled together. From that day I never saw Stephanie more.' Again he paused, and although there was no trace of emotion in his voice, it may be that the hidden depths of his being were profoundly moved.

'A little while later, *ma pauvre Marie* died. She had been ill a long time; but what killed her was the loss of Stephanie. Ah yes! After that, Henri and I set out, wandering from place to place, not caring much where we went, but always looking and asking for Von Rosenberg, because I want to demand of him what has he done with my child. All at once I discover him. It was at the house of this gentleman, Monsieur Brooke. Next day they tell me that he has gone away back to his own country, and they know not when he will

return. But I wait and wait while one week goes away after another, and at length he comes back. I hide myself in the wood. I climb into the thick branches of a tree, and stay there hour after hour till he shall be alone. At length I see him coming down the path that leads from the house to the chalet near the wood. He whistles as he comes, and he is alone. I wait a little while, then I come down from the tree and walk up to the chalet. The Baron is standing up, examining a pistol—a pistol with inlay of ivory and gold, and with strange figures marked on it. On the table close by is a heavy riding-whip. He has not heard my footsteps. I enter, and he starts and stares. I make him a profound bow, and say: "Bonjour, Monsieur le Baron. My name is Jules Picot, and I come to demand from you what you have done with my daughter Stephanie." He still stares, and seems to be thinking to himself how he shall answer me. At last he says: "I know nothing whatever of your daughter; and if I did I should decline to tell you." "She left Paris in your company," I reply. "Possibly so," he answers with an evil sneer. "Monsieur, I repeat that I am her father. I seek for her everywhere, but cannot find her. You, monsieur, if you choose, can give me some clue by which I may be able to trace her. Her mother is dead, and I have no other daughter. Think, *monsieur*—think." He laughs a laugh that makes me long to spring at his throat and strangle him. "I altogether refuse to give you any information whatever about your daughter," he says. "How, monsieur, you refuse!" I say as I draw a step or two nearer. He has laid the pistol on the table by this time, and his fingers now shut on the handle of the riding-whip. "Then you are a coward and a villain," I continue; "and I spit in your face, as I will do again and again whenever I meet you. I have found you now, and I will follow you wherever you go." He replies only by seizing the whip, hissing it quickly through the air, and bringing it down with all his strength round my head and shoulders. Strange lights dance before my eyes; there is a noise in my ears as of falling waters. The pistol is close to my hand; I grasp it; I fire. Von Rosenberg falls without a cry or a word. I fling the pistol away and walk quietly back through the woods. As I reach the village, where my boy is awaiting me, the church clock strikes seven. The evening is that of the 28th of June.'

He ceased speaking as quietly and impassively as he had begun: he might have been reading something from a newspaper referring to some other man, so little apparent emotion did he display; yet his hearers felt instinctively that he was speaking the truth.

'What you have just told us,' said the magistrate, 'will be taken down in writing; it will afterwards be read over to you, in order that you may make any additions or corrections that you may deem necessary; and you will then be asked to affix your name to the document. You will have no objection to do so, I presume?'

'To write my name on the paper, is that what *monsieur* means?'

'That is what I mean.'

'Certainement, *monsieur*, I will write my name. Why not?'

'Then for the present you are remanded.'

Picot looked round with a puzzled air; but one

of the constables touched him on the shoulder and whispered, 'Come this way.'

He turned to obey, and as he passed Gerald the eyes of the two men met. Gerald's hand went out and gripped that of the mountebank. 'O Picot!' was all his lips could utter. The mountebank stroked the back of Gerald's hand caressingly for a moment while a strangely soft smile fitted across his haggard features. 'Ah, monsieur, you and la belle madame will be happy again,' was all he said. Next moment he had passed out of sight.

Gerald was now replaced in the dock; and one of the magistrates, addressing him, said that although, on the face of it there seemed little reason to doubt the truth of the singular narrative to which they had just listened, it would have to be confirmed by ample inquiry before it could be accepted and acted upon. Meanwhile, he regretted to say Mr Brooke would have to remain in custody. But on the morrow, or next day at the latest, both prisoners would be transferred to King's Harold, when the amplest investigation would doubtless at once take place. With that the prisoner was removed.

Before going back to his cell, Gerald was allowed to see his wife for a few minutes. The meeting was almost a silent one; words would come after a time; just now their hearts overflowed with a solemn thankfulness, the roots of which struck deeper than speech could fathom.

As soon as Picot reached the cell allotted to him, he asked to be supplied with a cup of coffee, after which he lay down on his pallet with the air of a man thoroughly wearied out, and in a few minutes was fast asleep. He slept soundly till aroused some three hours later, when he was conducted to a room where he found one of the magistrates, the clerk, the governor of the jail, and two other officials. Here a paper, which had been drawn up from notes taken in the justice-room, was read over to him. After having caused it to be corrected in one or two minor particulars, he affixed his name to it; and his signature having been duly witnessed, he was reconducted to his cell.

About eight o'clock, after the gas had been lighted, he asked for pen, ink, and paper, and a small table to write on. These having been supplied him, he sat and wrote, slowly and laboriously, for nearly a couple of hours, finally putting what he had written inside an envelope and sealing and directing it. Then, after having taken off his shoes and coat, he wrapped himself in the blanket which had been supplied him and lay down to sleep. The gas was lowered, and silence reigned throughout the prison. Once every hour during the night a warder went the round of the cells and peered into each of them that was occupied through a grating in the door. All through the night Picot apparently slept an unbroken sleep. When the warder visited him at one o'clock he found that he had turned over and was now lying with his face to the wall, after which he seemed never to have stirred between one visit and another. At seven o'clock another warder, who had just come on duty, went into his cell to rouse him. To his dismay, he could not succeed in doing so. He turned the unconscious man over on his back, and then the drawn, ghastly face told its own tale.

'Ah,' remarked the doctor, who was quickly on

the spot, as he held up to the light a tiny phial only about half the size of a man's little finger and smelt at its contents, 'five drops of this would kill the strongest man in three seconds.'

LAST YEAR'S RAILWAY ACCIDENTS.

THE year 1888 was distinguished by a happy immunity from any serious railway tragedies. Of minor accidents there were, of course, enough and to spare; but no wholesale disaster marked the railway annals of the year. Most people, we imagine, will be surprised at the figures returned to the Board of Trade up to December 31. Thirty-five collisions between passenger trains, resulting in one death and two hundred and seventeen injuries; and fifty-four collisions between passenger and goods trains, resulting in nine deaths and two hundred and ninety-two injuries, seem to represent about as much security for railway travellers, so far as this head of accidents is concerned, as we are ever likely to attain in this most imperfect dispensation. The most that we can hope is, indeed, that the returns shall show a continued decrease in the number of killed and wounded, so as to encourage the customers and servants of the Railway Companies in the belief that they are exposed to a degree of peril which grows less year by year. And, taking into account the millions of lives whose safety has been entrusted to the Companies of the United Kingdom during the time, the figures are certainly remarkable.

The totals of the period covered by the returns are nine hundred and five killed and three thousand eight hundred and twenty-six injured, from all causes whatsoever inclusive. Analysing these figures, we get one hundred and seven passengers killed and fourteen hundred and eight injured; three hundred and ninety-six servants killed and two thousand one hundred and ninety-three injured; the remainder consists of trespassers, suicides, and other persons not coming under the above classification. Now, these totals not only show a decrease on those for the same period of the preceding year, but are relatively very low. Accidents occurring on the premises of the Railway Companies, but in which the movement of trains was not concerned, are not included in them, and since in all of these the sufferers are themselves more or less to blame (as, for instance, in ascending or descending steps at stations, falling off platforms, loading or unloading wagons, and so on), they are not properly included in 'railway accidents.' We may therefore take the figures as they stand.

And if the causes of these deaths and disasters be classified, we get further evidence of the watchfulness and care with which the railway business of the country is now unceasingly conducted; for a very large proportion of these accidents are due wholly or in part to the carelessness and negligence of the public or of railway employees. Thus, nineteen passengers were killed and fifty-six injured by falling between carriages and platforms when getting into or alighting from trains, for which foolhardiness they have obviously no one but themselves to blame. Besides these, seventeen were killed and five hundred

and twenty-six injured by falling on to platforms, ballast, &c., when getting into or alighting from trains, presumably in motion, although it is not so specifically stated. Again, the twenty-eight killed and sixteen injured when passing over the line at stations; the fifty-three killed and twenty-four injured whilst passing over railways at level crossings; the two hundred and seventy-three trespassers killed, the ninety-five trespassers injured; and the sixty-five suicides, are one and all wholly or partially responsible for their own deaths or injuries. Nor are railway servants more careful, for a still larger proportion of the accidents to this class are due, at least in part, to 'contributory negligence.' We do not know how far it is necessary for the employees of the Companies to get on and off trains, wagons, or engines in motion, nor what are the by-laws of the Companies in their behalf. Shunting operations, doubtless, often require men to undergo considerable risk in this way; at least eighty-two men were killed and no fewer than nine hundred and forty injured while doing this kind of work. Coupling or uncoupling vehicles, too, although often performed in a most casual manner, not only always appears to be horribly dangerous to the ordinary observer, but is so as a matter of fact, fifteen deaths and two hundred and fifty-eight injuries being put down under this heading. Allowance being made for the perils of their calling, it is clear from these facts and figures that railway servants are often tempted by familiarity to despise danger. But it is very gratifying to know that the total number of servants killed is little more than half the average of a few years ago. In 1881, for instance, this exceeded five hundred; and it is still lamentably high. The public are entitled, and not alone on selfish motives, to demand that as much help and protection as possible shall be afforded to the whole army of pointmen, plate-layers, drivers, firemen, guards, and porters, to whom they are immediately indebted for the comfort and safety in which they are enabled to travel.

There are probably few people who have not been struck with the amazing coolness with which nearly all the work of railway-men is performed. Who has not stared aghast at the sight of an engine-driver or stoker walking along the plates of the engine while it is going at full speed? This, again, may be a type of peril incidental to their calling; but it is worthy of note that twenty-two deaths and one hundred and seventy-five injuries actually occurred last year from falling off engines, &c. during the travelling of trains. Six deaths and thirty injuries, put down as having happened from 'coming in contact with over-bridges or erections on the sides of the line during the travelling of trains,' is an item which it is hard to explain as it stands. We hear, of course, of foolish or drunken passengers putting their heads out of carriages, or even climbing out on the roof, and so meeting a terrible death; but it is difficult to believe that railway-men would be guilty of any such foolhardy conduct. And it seems equally incredible that any erections can be permitted to remain so close to the permanent way as to be dangerous to life with ordinary precautions. Gates on level crossings are not nearly so dangerous to servants as to passengers, only two railway-men being killed and four

injured under this head. The low rate of ten deaths and forty-nine injuries whilst 'attending to ground-points and marshalling trains' is due, probably, to the very large diminution in the number of points which are now worked by levers on the level. Plate-layers and others working on the permanent way always carry their lives in their hand, and, sad as it is, no one will be surprised to hear that sixty-six were killed and sixty-seven injured in the United Kingdom in twelve months.

Walking, crossing, or standing on the line on duty are also lamentably fatal, ninety-eight deaths and one hundred and thirty-one injuries being put down to these causes. It is, however, incomprehensible that no fewer than fifty-six railway-men should be killed and twenty-nine injured whilst walking to or from their homes, and the fact seems to show that this use of the road should be as far as possible forbidden. The lessons pointed by the figures is indeed conclusive to show the need which exists for the Companies to adopt all possible regulations to diminish the risk of the calling. The death-rate must always be very heavy amongst these men. It is impossible to take away all risk from their arduous and dangerous daily duties; but something more might yet be done to reduce it, if possible, to a still lower average. That it should have been lessened so much as it has is enough to show that much can be accomplished by increased care. Nor should it be difficult to obviate many of the perils now incurred every day. There cannot be any real necessity for porters to cross the rails immediately in front of a train in motion, although, as many people have doubtless observed, that is almost invariably the time and method they choose. In short, unless and until railway-men are compelled to exercise ordinary care in their work, the rate of fatalities and casualties among them must remain needlessly high.

Turning from the loss of life and limb to the Reports of the Board of Trade Inspectors on the collisions of the year and the table of accidents to trains, the satisfactory character of the record is maintained. The great reduction in the number of accidents from collisions between passenger and goods or mineral trains is no doubt mainly due to the improvements which have so largely been carried out of recent years in the permanent way. Many of the great Railway Companies, for instance, have doubled the road throughout a great part of their system with an enormously increased degree of safety to the travelling public. Certain elements of risk can, of course, never be wholly eliminated. In the twelve months under notice, for instance, there were one hundred and thirty-one cases of trains running over cattle or other obstructions on the line, although, happily, only two passengers and one servant were thereby injured. 'Twenty-four horses, forty-seven beasts and cows, seventy-three sheep, two donkeys, four hounds, one goat, and one dog' were during the period in question run over and killed, and with no greater loss of human life. It is clearly, as Stephenson predicted, 'so much the worse for the coo' when these little mishaps occur.

The bursting of boilers, failure of machinery, springs, axles—of which there were two hundred and ninety-nine cases, involving death to five passengers and injury to fifteen passengers and four

servants—brake apparatus, couplings, ropes on inclines, and rails are, so far as they are indispensable to the service, practically outside human forethought. It is remarkable, too, if unavoidable, that no fewer than six hundred and sixty-eight tires should have failed, and still more wonderful that they should have involved no personal injury. Of the accidents inquired into by the Board of Trade the causes were multitudinous. The mistakes of porters, number-takers, signal-men, engine-drivers, which were found by the Board of Trade Inspectors to be the cause of some few of these disasters, are of course inevitable accompaniments of a system which depends so largely upon human agency. 'It is human to err,' and in all mundane affairs allowance must be made for what astronomers call the 'personal equation.' It is, however, gratifying to know that there was in 1888 no single instance in which human fallibility was increased by undue fatigue on any of the railways in England, Wales, Scotland, and Ireland. None of the cases cited in the Return point to excessive hours of work as even a subsidiary cause of errors of judgment. A signal-man who has to attend to dozens of levers cannot, when jaded with fatigue, be regarded as responsible for his actions, and in past years many grave cases of hardship have been made public. We are therefore glad to see that the Companies appear to have recognised their responsibility in this particular. The working-day of railway-men is no doubt still long enough, if not too long; but we do not hear of such grave scandals as the safety of the lives and limbs of perhaps hundreds of passengers being entrusted to a man worn out with sixteen hours' continuous strain on head and hand. The Hampton-Wick accident is a good illustration of pure mistake as a cause of danger. In that case a signal-man, by neglecting to hold down a lever a little longer, let an engine run to Twickenham on the down instead of the up line. Neither the driver nor the fireman noticing the mistake in time, the engine ran into a down passenger train, with the result that four persons were killed and sixteen injured. At the time of the collision, Major Marindin reported, the signal-man had been on duty for about six and three-quarter hours, and the driver and fireman of the light engine for about nine and three-quarter hours.

This accident was also important as explaining the electric bell signals on the London and South-western Railway. These are not uninteresting or without considerable significance. Thus: 'One beat - acknowledgment; two beats - four beats - five beats - (ballast train) departure signals; two beats given twice - warning signal; three beats - all clear; six beats - obstruction danger signal; seven beats - error signal; eight beats - attention signal; nine beats - testing signal; ten beats - special attention signal; twelve beats - assistance signal; four beats given twice - closing signal; and ten beats given twice - special danger signal.' It will be noticed that these are considerably and, we think, unnecessarily complicated. In the case in question, if the next signal-man had been warned in time, he might, it is suggested, have thrown his signals against the engine and so have prevented the

collision. But the signals which would have had to be given according to the block regulations appear to be the 'obstruction danger signal,' six beats; and then, when this had been answered, the 'special danger signal,' ten beats repeated twice. This operation cannot be completed in less than twenty seconds, and so would have been, it is thought, too late to avert the disaster. Major Marindin proposes very appropriately that there should be 'some very short code or other telegraphic or telephonic signal on receipt of which a signal-man should throw all his signals to danger.' To this may be added the suggestion that it would be conducive to the public safety if the Board of Trade were to settle some code which should be adopted throughout the United Kingdom. It would possess obvious advantages over the present system.

But the main conclusion to be derived from the Report—and indeed from the whole Return—is the marvellously high degree of safety and security which has been reached and promises to be maintained on 'our iron roads.' In spite of all the multitudinous elements of danger, whether preventable by human prudence and forethought or not, and notwithstanding the large amount of unavoidable risk necessarily attending any locomotive system, and enhanced by its high development, the total number of accidents of all kinds is now probably as low as it will ever be. And for this the public are indebted in no small degree to the zeal and energy of that inestimable body of men our railway servants.

CHARLIE RANSOM.

A STORY OF THE OIL COUNTRY.

CHAPTER II.

CAPTAIN PETER presented a most imposing appearance, for, in addition to his full-dress suit, he had resurrected from the bottom of his trunk a plum-coloured necktie with yellow spots, which he now wore to great advantage. His black velvet waistcoat was only fastened by the top button—there was some difficulty in persuading the lower buttons to pair with the button-holes—and his hands were thrust deep into the pockets of his trousers, from which imprisonment he only released them when he found it necessary to 'pull down' his waistcoat or flick an obstinate particle of dust from his coat lapel. If the captain could but have secured a silk 'stove-pipe' hat, in place of the very large and very dirty 'ten-cent straw' which shielded his brow from the afternoon sun, his outfit would have been beyond criticism.

About four o'clock the Captain was joined by his coadjutors, John Reed and Joe Klip, and together they sallied forth along the road by which the schoolmistress and her escort must necessarily approach Pan Handle City. They had not proceeded very far when a cloud of dust, visible about half-way up the hillside, apprised the three men of the approach of a vehicle drawn by at least two horses, and evidently moving at a rapid rate.

'Here she comes!' shouted Captain Lamson,

withdrawing his hands from his pockets to rub them with child-like glee.

'In Gus Hartranft's sociable,' said Reed.

'Yes,' added Joe Klip; 'and I'll bet Gus is a-driving 'em hisself with his sorrel team. Lord, but they're a-humping along over that there road! They'll be here in—let me see—well, I give 'em fifteen minutes at the outside!'

The travellers were still nearly three miles distant, but Mr Klip's prognostications proved correct; and, sure enough, in less than the time allowed, Gus Hartranft, the landlord of the hotel at Mesopotamia, reined in his spanking team in response to a signal to halt given by Captain Peter. As the sociable—a long ungainly sort of a light wagon, capable of carrying six persons, distributed over three seats—slackened up, Cockney Ted clambered down.

'Ere we are, Captin,' said he. 'Couldn't get here sooner, 'cos Gus wasn't home, and his woman wouldn't let no one else drive us over.'

But Captain Lamson was neither looking at his friend Mr Robinson nor paying any heed to that gentleman's greeting and explanation. His eyes were riveted upon a remarkably fair and prepossessing specimen of young womanhood, who, without any assistance, had quickly and gracefully alighted from the high wagon to the roadside.

What Captain Lamson had really expected in the schoolmistress, not he himself could have explained, although he had known full well that 'a hummer' was something far beyond the average in feminine comeliness, and had dressed himself accordingly. But, as he many times afterwards confessed, he had certainly never dreamed of beholding in all his life—to say nothing of employing as teacher for the Pan Handle City youngsters—so much grace of form and quiet yet exquisite loveliness of feature as he beheld in the enchanting young woman who now stood before him with extended hand.

'I am quite certain that you are Captain Lamson, because I have already heard so much about you,' said the lady with a smile, which instantly secured each man in the little group as her steadfast friend. 'Mr Robinson evidently does not intend to introduce us,' continued she with a mock frown, directed at Cockney Ted, 'so we will just introduce ourselves.' Then she made a pretty courtesy, and, as if she had been at a society-lady's reception, said: 'How do you do, Captain Lamson? I am delighted to meet you.'

Now, for several days Captain Peter had been turning over in his mind—and had actually rehearsed to Mrs Lamson—a well-rounded speech of official welcome for the teacher. But the moment for the delivery of the speech having arrived, the Captain found himself unable to recall a single word. Indeed, when his eyes first rested upon the teacher, he was actually dazzled to a slight extent, and could only see before him a sweet face and a shapely form enveloped in a perfect-fitting travelling dress of gray. All he did was to doff his hat, rather confusedly; but when he heard the cheery, friendly voice and felt his hand grasped by that of the pretty woman, Captain Peter forgot all about the speech and his official dignity as Chairman of the School Committee, and in his own 'every-day' good-natured

style, responded: 'Thank ye, my dear; thank ye kindly. I'm sure we shall all like you more'n a little. I hope you'll soon feel to home, Miss—er—Miss—'

'Well, well,' she interposed, 'I did make poor work of that introduction, after all, didn't I? My name is Marie Reese—R-e-e-s-e, Reese.'

'Good,' said Lamson. 'I'll remember.—Now, my dear, you'll be tired after your long ride; so we'll all climb into the sociable and ride up to my house, where my missis has fixed up a room for you, and where we both of us hopes you'll stay and make it your home so long as you find it comfortable and convenient.'

But Miss Reese protested against riding any farther. She persuaded Ted and the rest of the men to go on in the wagon with her baggage, while she walked the half-mile with her future host.

The teacher had evidently taken a liking to Captain Peter, for she conversed with him quite freely; and by the time they reached the house and sat down to a choice supper prepared by Peter's wife, the Captain felt quite well acquainted with this pleasant addition to his household. During the walk he learned that Maria Reese was not a destitute girl, forced to work for a living; but that she preferred to be independent of unhappy surroundings in a home that had never been home to her, and was very glad to break away from the humdrum life of the towns for the free and informal atmosphere of the Oil regions and the mountains. She had met Mr Van Horn and his companion at Elmira, and had quickly closed with their offer of 'two hundred and fifty dollars and board' for the school term of eight months at Pan Handle City.

The favourable impression created by Marie Reese upon Captain Peter Lamson and his colleagues was reproduced several times during the next few days upon others of the Pan Handle citizens; and before the day for opening school, the new 'schoolmarm' had become, without any exception, the most popular person in the Upper Ton-hicken Valley. Maria Reese was quite young—not yet twenty-three—but she was possessed of more than mere 'book-learning.' She displayed much excellent judgment and good common-sense in many ways, and proved herself to be in a measure a careful student of human nature. Adding to all these qualifications her personal charms and a cheery disposition that was magnetic, the School Committee might have scoured the world over and would never have discovered a more suitable teacher for the very ignorant and decidedly erratic youngsters who formed the school population of Pan Handle City.

On the first day of September, Captain Lamson experienced the keen satisfaction of escorting Miss Reese to her desk in the little school-house, and in a very neat speech introduced the teacher to the two score of children who filled the narrow benches. The pupils were of both sexes, and of all ages from three to thirteen or fourteen; but all alike were ignorant of the first rudiments of schooling. There the resemblance ended. Some were smart and some witty; while others were slow, stupid, and dull; a few were polite—eager to please and willing to learn; but many were rude and stubborn. Yet Marie Reese, fully intent upon doing thoroughly and to a finish the

work which she had undertaken, discovered a 'soft spot' in all their young hearts, and in time found for all of them a common plane upon which teacher and scholars could meet and understand each other. Thus, from the very outset the school at Pan Handle City was a complete success; and not a man who had attended the meeting at the Barrel House of Well No. 4 regretted having pledged his name for the school-house assessment.

But when winter arrived, a new phase of the school question presented itself in the large number of applications for admission received by the Committee from some of the elder boys and young men of the settlement.

The Oil regions of North-western Pennsylvania are usually visited by long and severe winters, which render it impossible to carry on active operations, either in connection with the oil industry or upon the scrubby farms, to as large an extent as during the summer months. This state of affairs throws a large number of 'helpers' out of employment; and at Pan Handle City these unfortunates, imbued with a laudable ambition to improve the days of enforced idleness, ardently desired to become pupils at the little school-house. It is more than probable that the novelty of a school and the popularity of the 'schoolmarm' greatly enhanced the ardour of this longing to study blackboard lessons; but be that as it may, Captain Peter was subjected to a dozen or more personal interviews from candidates for seats on the narrow benches.

Captain Peter was not greatly in favour of admitting these 'big louts,' as he termed them. 'The school-house was intended for the children,' he argued; 'and while there's no denying of it that some of these long-legged, shock-headed fellers is no more'n overgrown kids, I don't believe in turning a lot of awkward boys, as big as I am, loose among the little uns. Besides, that teacher of ours is a sight too good and too kind to be bothered with a lot of thick-skulled chumps. No, I don't like the notion.'

But when the Committee talked it all over with Miss Reese, they found her very willing to make the experiment. 'By all means let them come, Captain Lamson,' said she. 'Give them a permit to attend school in the afternoon. I can dismiss the little ones about half-past three, and then I can devote an hour or so exclusively to the young men. I think I can manage them; and if they become obstreperous, I will call upon you for assistance. But I have great faith in my own capabilities with big boys as well as with little ones, and I should rather like to give them a trial.'

So that phase of the problem was solved.

Among the 'institutions' of Pan Handle City was 'The Doll.' In America it is absolutely impossible for any one with any individuality or peculiarity of dress, manners, or appearance to evade the honour (or otherwise) of a nickname. When, therefore, Charlie Ransom—chief officer, steward, wheelsman, and supercargo of the *Petroleum Gem*—made his first appearance at 'the City' he had evoked the exclamation 'Ain't he a doll!' from a score of admiring onlookers. The term, frequently used sarcastically, was in that particular instance a tribute of genuine admiration for the strapping young fellow with his finely-

moulded limbs, his open ruddy face, his curly-flaxen hair, and, above all, for the unimpeachable 'rig-out' in which he walked from his cubby-hole aboard the *Gem* to the landing at 'the City.'

The reader need not imagine that Mr Ransom would have been considered a 'howling swell' in the Row or on the Chain Pier; indeed, it is doubtful if he would have attracted any particular attention on a Saturday evening in Shoreditch or the Bowery; but he 'walked away' with anything ever before seen in Pan Handle City—not even excepting Captain Peter Lamson in his velvet vest and spotted necktie. For the Captain had never been known to indulge in a collar, while his only styles of headgear were a 'ten-cent straw' in summer, and a cub-skin hat in winter; whereas Charlie Ransom sported a billy-cock hat, a collar and necktie, a suit of black diagonal cloth, which had probably cost as much as nine dollars in a Hebrew hand-me-down store in Oil City; and, above all, displayed the unheard-of luxury of blackened and polished shoes. And this was not merely Charlie's high-day and holiday outfit: always when the *Gem* was 'laid up' at Pan Handle City, Ransom in his off-duty hours was uniformly neat and tidy in his appearance. For this reason the boys had applied to him the sobriquet of 'the Doll'—a title by no means resented by Ransom, who was good-nature itself, and a great favourite with most of the people along the Tomhicken.

The creek being frozen over, and the *Gem* being boarded up for the winter, Charlie was among those who about the end of November became privileged afternoon pupils of Miss Reese.

Charlie was in his twenty-first year; but it is safe to say that his school experience had not extended over more than two years, and during the decade which had elapsed since he left school 'for keeps,' he had well-nigh managed to forget all that he had ever been taught. But he was evidently very much in earnest in his desire to make the most of the present opportunity. He applied himself with such diligence as, added to his natural ability and his pride, enabled him before Christmas to forge far ahead of every other pupil in the school. Of course his progress was peculiarly gratifying to Marie Reese, who was marvellously well pleased with the general behaviour and fair success of her older scholars. There were few of them, however, who could appreciate the schoolmarm's painstaking kindness to the same extent as Charlie, because, as yet, there were none of them beside him who could make headway fast enough to require any personal attention. For the same reason, none of her scholars awakened in Marie the same degree of interest; and the girl made up her mind to surprise both Ransom and the School Committee by the advance in his studies which she proposed that her favourite pupil should achieve before the next opening of navigation on the Tomhicken.

The week before Christmas, Miss Reese announced that the school would be closed during Christmas week, and on Saturday afternoon the schoolmistress and Charlie were the last to leave the school-house. As they walked together towards Captain Peter's house, the moon was just rising over the hilltops, gradually flooding the broad Valley with its silvery light. Far away, winding like a white ribbon for miles down the

Valley, they could see the ice-covered river, and the sight instantly aroused in the girl a desire to indulge in her favourite sport. 'Now, if I only had my skates here, Ransom, you could take me to skate next week. We shall have no school, and a few spins down the creek would be splendid recreation.'

'I'm a regular no-account skater, Miss Reese, so I couldn't help you very much on the ice.'

'Ah, but, you see, I'm a splendid skater, so I could help you. You would soon be clever yourself if you skated with me much, and I am sure we could have great fun. But, alas, no skates!'

'Don't you fret about skates, Miss Reese; I think I know where I can lay my hands on a pair. I know I can get some for myself. I've got a little errand to do on Monday; but if you will wait until Tuesday, I'll see about the skates.'

That night the Doll intercepted Mrs. Lanson on her way to visit a neighbour, and secured from her one of the teacher's shoes. This the lad secreted in his coat pocket, and straightway started on a long night-tramp to Mesopotamia Cross Roads, where, next day, he hired a horse and buggy and drove to Clipper Gap. Being Sunday, he was forced to put up at the hotel and wait until Monday morning before making his purchases; but he was the first customer of the week at the little hardware store where, much to his surprise and satisfaction, he succeeded in fitting a pair of skates to Miss Reese's shoe. Then, having suited himself with a pair, he started on his homeward trip, returning as he came. He reached 'the City' late on Monday, and on Tuesday—which was Christmas Eve—he presented himself at Captain Peter's house and inquired for the teacher.

'Miss Reese, marm, being as it's Christmas-time, I hope you'll excuse the liberty and accept a little token of the season from me. You've been very good to me, marm, and I can't pretend ever to pay you for it. But I thank you hearty, and hope you'll enjoy many a spin on them little bits o' skates, marm.'

That was not the only instance of Charlie's kindness to the schoolmistress, for his thoughtfulness represented itself in many ways. Nor, when he escorted her upon her skating trips, was it the only time that Marie Reese accepted personal attentions from Charlie Ransom. So marked, too, were these attentions, that the women of Pan Handle City nodded their heads wisely to each other as they muttered: 'The Doll's sweet as new cider on the schoolmarm.' Even the men noticed the apparent state of affairs, and easy-going Captain Peter shook his head disapprovingly.

'She shouldn't do it,' he said to himself; 'she'll turn the Doll's head, sure—indeed, it's turned already or I'm no judge of oil and fools!'

But Marie Reese, with her mind absorbed in her work and her heart safely in the keeping of a man four hundred miles away, believed herself to be an excellent judge of human nature. She knew perfectly well just how much she was interested in this bright and good-hearted lad, and furthermore, she believed that she thoroughly understood Ransom. The Doll, too, was fully aware of the depth and quality of his admiration for and devotion to the schoolmarm: on the other hand, in the study of human nature Charlie Ransom was an ignoramus, and did not pretend to

fathom or understand the extent of Miss Reese's friendship for himself. Indeed, he rather wished that he could, and gradually the desire to solve that very question became the all-absorbing subject which agitated the heart and mind of the Doll.

THE ONLY ROMAN THEATRE IN ENGLAND.

TOWARDS the southern portion of the county of Hertfordshire, and within twenty miles of the Metropolis, lies the ancient city of St Albans. It is a quietly-quaint, old-fashioned place, abounding in many visible memorials of the most remote antiquity; and the traveller fresh from the busy turmoil of the City, steps from the express, which in thirty minutes has carried him from St Pancras, with that indefinable feeling which we experience when brought into contact with the venerable relics of past ages. For here, indeed, he treads on classic ground. Associations with many historic names are brought to memory; here Cassivelaunus defended his marsh-begirt city from the legions of the conquering Caesar, and his walled huts gave place to the great Roman *municiplum* of Verulamium, whose inhabitants, born within its walls, had the right of proudly saying, 'Civis Romanus sum,' and could claim the privileges which this right of citizenship conferred. Here Boudicca, 'bleeding from the Roman rods,' wreaked her vengeance upon the invader, for, according to Tacitus, seventy thousand inhabitants fell beneath the swords of the infuriated Britons. But the devastated city regained its former greatness; large and massive buildings were erected, and a huge wall of considerable height and over twelve feet in thickness was built round the city, with a broad and deep ditch externally.

From the Temple of Apollo, towards the end of the third century, Britain's protomartyr, Saint Alban, was forth to die. He was taken outside the walls, across the small river Ver, and executed on the summit of a grass-crowned hill now covered by the modern city. The Roman power in Britain ended in 410 A.D., and for three hundred years the wild Saxons, and after them the Danes, swept over Verulamium, burning, sacking, and plundering.

In the eighth century, Offa, king of Mercia, founded the magnificent monastery which lasted, under forty successive abbots, to Henry VIII's time, when it was demolished, two buildings alone being spared—namely, the great gateway and the venerable abbey. These buildings had for the most part been constructed of the remains of the Roman city, which acted the part of a quarry for many centuries. A great portion of the abbey, including the massive Norman tower, is composed wholly of Roman brick; and the familiar tile-like form of the latter is recognised in many buildings of the modern city.

The extent of Verulamium may easily be traced at the present day by huge masses of masonry and a deep fosse which mark for a considerable distance the ancient boundary. The general shape of the Roman city was elliptical; the longer axis being nearly a mile in length, and formed by a portion of the old Watling Street, and the shorter axis, about half a mile in length, by the Camlet Way. The area was one hundred and ninety acres. The

shape and size of Verulamium are very much like those of the buried city of Pompeii. When the British Archaeological Society met at St Albans in 1869, plans were shown of these two cities, and it was seen that not only did they resemble each other in shape and dimensions, but also in the relative positions of the temples, theatres, and the Forum. The side of Pompeii next the sea has the river Ver by it in Verulamium.

Inside the boundary walls no traces of ancient habitations are now apparent; the dark-coloured ground, covered in autumn by heavy crops of cereals, stretches in long undulations before the eye. With the exception of the massive girdling walls, all traces of the proud Roman eagles have disappeared. The great Forum, the long streets with their busy shops thronged with teeming multitudes, the courts of justice and statue-laden temples, the opulent Roman villas with their pleasant gardens and luxurious baths, all have gone; and where a proud and stately city once stood, the golden-eared corn waves gently to and fro, and the lark sings in unmoisted solitude.

At one point only has the site been invaded by buildings not of Roman origin. In this part stands the church of St Michael, built upon the broad foundations of the ancient Temple of Apollo. This church, which is of venerable antiquity, is the shrine of Baconians, for in it the bones of the great Lord Verulam lie resting. It was near this church, and close to the centre of the destroyed city, that the only Roman theatre as yet discovered in England was brought to light. Some forty years since, an archaeologist, while searching for Roman remains, discovered some flints embedded in mortar by the side of the road leading from the church to Gorbunbury, the Elizabethan residence of Sir Nicholas Bacon, father of the great philosopher, the picturesque ruins of whose house are still standing. He commenced excavations which laid bare the foundations of a building, evidently Roman. As soon as these had been completed, he learned that fragments of walls had been struck upon in ploughing the adjoining field. On hearing this, he began digging there, and succeeded with the aid of the British Archaeological Association in bringing to light the remains of a Roman theatre. In the following year a paper was read before the St Albans Architectural Society, giving an account of this discovery, which paper forms the source of what knowledge we have concerning it, since, after that time, the earth was levelled down again.

The earliest theatres were those of the Greeks, which had their outer walls containing rather more than a semicircle. There was an inner concentric circle, the diameter of which was one-third that of the theatre. The space included in this smaller circle was called the orchestra or place for dancing, and was devoted to the chorus. The width of the stage was twice the diameter of the orchestra, and its depth one-seventh of that diameter.

The Roman theatres were modelled on those of Greece; but the orchestra was much smaller, as the chorus did not occupy such an important part. The outer walls rarely exceeded a semicircle; and the orchestra, instead of being devoted to the chorus, was occupied by the seats of the spectators of highest rank in the state. The stage was more capacious than that in the Greek theatre, being

twice the diameter of the orchestra in length and one-fourth in depth, so as to afford space for the chorus on the stage. Round every ancient theatre was a corridor, forming a space between the outer wall and an inner concentric wall. Over the corridor were seats sometimes used by ladies; and the space between these seats and the orchestra was occupied by rows of seats concentric with the outer wall and rising like wide stairs, so that the spectators placed their feet on the next lower row.

The scene was at the back of the stage, and usually represented a street, or the front of a palace, or a wood, and could be changed to suit the locality of the play. Behind the scene was the postscenium, in which murders and other parts of the play were sometimes supposed to take place. At the sides of the stage were entrances to rooms built for the convenience of performers.

The theatre at Verulamium was one hundred and ninety feet three inches in diameter; the theatre at Pompeii one hundred and ninety-five feet. The two outer walls are on the plan of the Greek theatres, comprising 240'; between them was a corridor nine feet wide. The stage was forty-six feet long, and eight feet nine inches deep. At the east part was a room with a coarse tessellated pavement without any pattern, composed of tesserae of Roman tiles about one inch square, set on a very thin layer of concrete. This was one of the rooms at the end of the stage for the use of performers. The foundations of a corresponding room on the west side have not been found.

The outer wall of the theatre at Verulamium was five feet ten inches thick, the second three feet six inches, the *scena* two feet six inches, and all the other walls two feet. An entrance at the centre opposite the stage, and another on the east side, have been partially laid open; but no trace of one has been found on the west side. The space over the corridor was twelve feet wide, including the thickness of the inner wall, and from thence to the outermost wall of the orchestra was thirty-three feet. Immediately inside this wall were found traces of an inner wall a few feet from it, which probably formed a separation for some privileged class; the space it surrounded was the orchestra for the seats of the most distinguished persons. All the walls of the theatre, except, perhaps, the exterior, were painted in fresco. The walls were first plastered with mortar; this was reduced to a perfectly even surface; on it was laid a covering of the finest mortar, perfectly white, and seldom thicker than card-paper; and on this, while both the coatings of mortar remained wet, were laid mineral water-colours, which adhered to and dried with it. The colours being native colours, and not artificially prepared, cannot be affected by time or damp; and so, as long as the mortar retains its surface, they will remain uninjured.

It is strange that no direct mention is made of this theatre in history; but it seems likely that it is referred to in the Chronicle of Roger of Wendover, a monk of St Albans Abbey, in a story of a vision related by him. Probably until the ninth or tenth century the building remained in good preservation; but about that time Ealdred and Eadmer, the eighth and ninth abbots respectively of St Albans, are said by Matthew Paris to have thoroughly searched the ruins of Verulamium and carried off

all the building materials they could lay their hands on. Eadmer in particular disinterred a number of ruined temples, altars, vases, statues of heathen gods, urns and ashes, all which, as heathen remains, he carefully destroyed in his religious zeal. Possibly the theatre was one of the ruined 'temples.'

It is very tantalising to the archæologist of to-day to stand upon the site of this unique building and to know that but a few feet of envious earth separate him from a Roman theatre, whose very existence was not suspected until quite recently, and whose walls, built sixteen centuries since, and deftly coloured by the conquerors of the world, almost rise to the surface of the ground. Local enterprise has been lately stimulated with a view to the removal of the mould and the permanent disinterment of the building; but it yet remains to be seen whether the appeal will be effectual or not. We trust that the good people of St Albans will no longer permit this treasure of antiquity to lie hidden in the ground, but will soon add to their present long list of archæological objects of interest that of the only Roman Theatre in Great Britain.

A WILD YARN.

'TELL us a snake-story, doctor.'

The demand for this peculiar form of mental refreshment was manifested by the fifth officer of the good ship *Chittagong*, then steaming northward up the Red Sea at a speed which evoked the tepid ghost of a breeze out of the stagnant stillness simmering over the gulf, and sent Jebel Zaggar slipping from bow to quarter in the brief interval between day and darkness. Peeking little of a temperature which might have embarrassed a salamander, we crowded, seven or eight of us, like true fatuous Britons, into a cabin ten feet by eight and a half, the bedroom, sitting-room, library, study, surgery, menagerie, and general 'den' of the ship's doctor, to whom the above invocation was addressed.

'Snake-story!' ejaculated the man of medicine in a tone of cynical disgust, as he sat swinging his legs over the lee-board of his bunk. 'What do you want a snake-story for? Isn't the story of a snake enough for you—the natural life-history of any one of them? Why, you might chop out a half-inch slice from this beast anywhere you like 'twixt stem and stern, and find more wonders and marvels in it (and real ones too) than you will get in all the penny-horrible snake-yarns ever invented. But the fact is, people will swallow any amount of nonsense about snake-charming and fights with serpents forty yards long, when they wouldn't believe the extraordinary things that are simply commonplace, everyday facts about them. For instance, take the abnormal distribution of the internal organs, asymmetrical enough almost to shake one's faith in what is regarded as universally characteristic of the vertebrata, that lateral—There, don't howl! I'm not going to lecture! Don't light up till I've stowed these reptiles away, for they can't stand smoke, and then I'll tell you one of the queerest things about serpents that ever came to my knowledge—outside themselves, that is; queer enough to satisfy the fiver there, and true into the bargain.—Get off from the lid of the washstand for a moment, you

two, while I chock these boxes off with my instrument-case, all snug. Mind none of you come to me to have your teeth out after we leave the Canal; I don't want to find my snake-cages playing Isaac and Joss all over the cabin, if it comes on to blow in the Mediterranean, and she rolls!'

A silvery slender Cingalese rat-snake, which had been nervously twining its sinuous length in and out between the speaker's accustomed hands and around his arms, was allowed to slide back into its prison of mahogany-protected glass and perforated zinc; while the occasional hiss of a couple of sullen rock-pythons lying in an open box at his feet was smothered by the interposition of the shutter which secured their travelling-quarters. Possibly we all felt a little more comfortable when they were thus packed up and put to bed, in spite of our confidence in the doctor's assurances that we were in no danger of attack by his weird pets. The medical officer of the *Chittagong* was, as he himself expressed it, a confirmed ophiomaniac; afflicted with a lunacy for all reptiles and creeping things, but hopelessly 'gone' over snakes, which he caught or bought at every practicable opportunity, and fed and fondled till he reached home, where the surplus of his large private museum ashore went in the form of donations or exchanges to every zoological collection in Europe.

The serpents' cages being safely fixed between the shut-up washing-stand and the chest of drawers, and so forming an additional settee, which lightened the cover of the former apparatus of one moiety of its disproportionate burden, half-a-dozen pipes contributed their caloric to the already seething atmosphere, unrelieved by the scoop-shaped wind-shoot which angled vainly outside the open scuttle for any stray pulsation of the sultry night. Gold-laced caps were tossed aside and brass buttons loosed as the smokers relaxed their huddled-up limbs as far as the narrow accommodation and scanty human anchorage would allow, while the doctor extended himself at full length high above us on the grass mat which served him for bed-clothes. And in an endurance of heat and smoke which might have qualified for the Metropolitan Fire Brigade or earned the Victoria Cross, he spun the following:

You can't go in for out-of-the-way kind of 'critturs' like these all your life without meeting with some adventures more or less strange in connection with them. I have run across a few in my time, as you know by the fung-marks and scars on my arms and neck; but I don't think anything that has ever occurred within my experience of things snakey—and I was born and brought up amongst them and have been in pretty close companionship with them all my days—nothing, I say, that I have known of them in their casual relations with human beings has been more replete with glamour and romance and mysticism than the event I am going to relate. Though I stick to my original position for all that, remember—that the animals themselves are much more extraordinary in their structure and habits than the theatrical accessories of any drama of mere human interest wherein they have been unwilling actors or passive properties. Just think of the remarkable mechanism of their lower jaw, for example, and their facial bones, undergoing at each meal they make a spontaneous dislocation

by virtue of the loose ligamentous attachment—All right, all right; I won't, if you don't wish it! Vulgar sensationalism carries the day *versus* the magic and mystery of Nature; so here's your snake-story. I played but a very subordinate part in it, little more than that of a spectator; but, as in the scene whence all our troubles date, the leading *dramatis personæ* were a woman and a serpent.

Nearly twenty years ago there lived for a time in the neighbourhood of Rio de Janeiro a certain naturalist, whose avowed speciality was ophiology, more particularly the study of venomous species, with that most futile and fascinating quest which has exercised the mind of man from prehistoric ages to the present day, and which is as vain and as engrossing now as in the beginning—the search for an antidote to the poison. He was comparatively a young man, certainly on the right side of forty, unmarried, and possessed of wherewithal to ensure the timely appearance of the daily bread independently of labour with hand or brain even in that ruinous part of the world; not a native Brazilian, but a Portuguese, who, after studying in the medical schools of Paris and Vienna, had left Europe to take up his abode in tropical lands in order to facilitate his especial pursuit. Lacerda with his permanganate of potash theory had not arisen in Rio at that time; Halford's experiments with ammonia on the thanatophobia of Australia, and those of Fayer in India, were too remotely Oriental to impress a South American public; and a taste for the collection of living serpents and an investigation of their manners and customs were apt to be regarded as a curious phase of mental aberration in those days by the 'Fluminenses,' as the inhabitants of Rio de Janeiro jocularly style themselves. Perhaps it was a consciousness of this which led our ophiologist to betake himself and his reptiles to a picturesque nook on the island of Paqueta, one of the largest of the three hundred and sixty-five which dot the glorious bay. Here he established his vivarium and read, wrote, analysed, and dissected; attended by his black servants, in very cool and comfortable quarters, and varying the routine of his life by snake-hunting excursions into the interior, or holiday trips to the city, fifteen miles off; for his devotion to work by no means precluded his enjoyment of social pleasures. With the *entrée* into the best native and foreign society, he would run over at frequent intervals in his little steam-launch and put up for a week or so at the *Estrangeiros* or Carson's, while he shared in the amusements of the gaily-loving town. Let me say at once that I firmly believe him to have been an honest and enthusiastic student of his subject, an earnest labourer in the vineyard of science, and one who must have left his name written in golden characters upon the history of research, but for the tragedy in which he and all that should have made his fame were lost. It was my great wish to meet him in person; for our common craze had already knitted a bond of union, and had led to correspondence between us; but I never saw him, though I stood by his dishonoured grave before the earth had lain many hours upon him. Poor fellow!

He fell in love. How often those four words preface the chapter which is the beginning of the end of the tale! He fell in love, miserably, hope-

lessly, yet hopeful against hope. He met her during Carnival, whilst staying at the mountain hotel at Tijuca! They met at dinner, they met in the *sala*, they met by the Cascades; they went down in the same diligence to Boa Vista, and thence by the same train-car to witness the *satur-nalia* in the city far below. It's all told in a very few words. She was an English girl, just arrived with her father, an official high in the diplomatic service. Both eagerly and gratefully accepted the guidance and good offices of the courteous Portuguese, who spoke French fluently, and whose knowledge of the country made him quite an old inhabitant by comparison with themselves. With him they visited the Avenue of Palms in the Botanic Garden; with him they made the ascent of Santa Theresa and climbed the Corcovado; with him they wandered at daybreak round the gorges of the Chinese View. The steam-launch bore them over to Paqueta, where they shuddered at the snakes, and saw with marvel the tact and intrepidity with which their owner handled them. Then a month later her *fiancé*, also in the service of the Government, came out from Constantinople via Lisbon by the Royal Mail, and they were married at the Embassy. She with her husband and father went to live at Petropolis; he returned to his lonely *quinta* and vivarium on the island. Ah me! the Brazilians have a proverb about the most dangerous snakes being *cobras vestidas y pentiadas*—the serpents that wear clothes and comb their hair; and they're not far wrong!

I'm not going to indulge in any psychological speculations as to his mental and moral struggles, his battles and doubts and resolves. That such a mind as his would suffer acutely, and that it might be torn and tossed in a fearful conflict, there can be no doubt. But whether he formed any deliberate plan of action, or whether he simply allowed himself to become the prey of circumstances in what followed, none can know. All that is certain is that a short time after the wedding—a few weeks or months, I don't know how long—he set out on a snaking expedition among the Orgão Mountains, put in an appearance at Petropolis, and was greeted with effusive welcome by his late acquaintances in their new home. About this period I came round from the Pacific coast in a steamer which was a day or so overdue when we got into Rio, having been detained by a *pampero* which blew heavily north of the Plate. The *pratique* boat brought me a letter dated two days previously, beseeching me to come immediately to Petropolis to see a gentleman suffering from snake-bite; so, without waiting to ponder over a certain mystification about the summons and its details, I at once embarked in the Mississippi river-boat sort of craft then just starting on the first stage of the journey, deferring my long-looked-for visit to Paqueta—where I could see the very house as the steamer glided by—till my return. I had furnished myself with the newspapers to while away the time; and sitting down in the saloon after a couple of hours' deep draught of the never-sating beauties of the bay, the first paragraph which caught my eye as I unfolded the *Jornal do Commercio* was a brief announcement of the death of the savant whom I so desired to meet. He had been bitten, so the account stated, by a *curucucu*, one of the worst of Brazilian

serpents, two days before, and had died in less than an hour, on the very date which the letter in my pocket bore, and at the very spot for which I was then bound.

As soon as I reached Petropolis, I was conducted without delay, by a messenger who had been sent to meet me, to the bedside of the patient, an Englishman, evidently of good position, but personally unknown to me. His friends, it seemed, had become aware that I was expected to come to Rio at the time when the accident happened, and—misled by sundry current fables as to my knowledge of miraculous cures for serpent-bites—had instantly despatched the urgent appeal which I had received on my tardy arrival. It is needless to say that the primary issue of the man's life or death was long since decided; the native physicians attached to the imperial court had done everything for him that skill and science rendered possible, and all question of specific treatment had been at an end for thirty-six hours or more. But he was still very ill, and by no means out of danger of the secondary complications—not seldom fatal in themselves—which may follow a venomous inoculation—shock, gangrene, blood-poisoning, and other disastrous consequences. The bitten hand, the whole arm, and even that side of the chest, were terribly swollen, and the constitutional symptoms severe; but there were certain appearances and phenomena in the case which I could not reconcile with any past experience of these matters, though the Brazilian doctors, not being specialists in this form of injury, had perceived nothing anomalous in them. And so it came about that on my mentioning these discrepancies to the sufferer's charming wife and his father-in-law, the obvious air of mystery and reserve which had manifested itself all through their agonised anxiety was resolved, after a brief consultation between them, by their confiding to me the secret of this hideous affair. No wonder that they were almost beside themselves with grief and horror and the conscious necessity of suppression and concealment! You have guessed, of course, who the patient was—the newly-made Benedict.

As I have intimated, the naturalist had been received by them with open arms, for no suspicion of the emotion entertained by him had crossed their minds. Unaffectedly desirous to repay the recent civilities at Tijuca, they had exerted themselves to the utmost to render his visit a pleasant and memorable one; indeed, so fervid was the warmth of their hospitality that they had even done their best to procure live serpents for him. In this endeavour, however, they had been successful only to a very limited extent, since the slaves who were sent out to scour the forest-clothed hills for *bicos* brought in but one specimen uninjured among many dead, and that one proved to be of no great scientific interest, though a pretty and harmless little creature, a bright grass-green whip-snake. Its recipient, taking it out of the glass jar in which its captors had imprisoned it, as coolly and quietly as though it had been a yard of inanimate ribbon, opened its long arrow-shaped jaws to demonstrate the absence of fangs in its mouth, and then proposed that his hostess should herself retain it as a pet, showing her how to handle it so as to avoid exciting its anger. This she accomplished—most women can manipulate a snake far better

than a man—to her half-terrified delight; and presently her husband, who had been abjectly afraid of the reptile at first, growing bolder by the contagion of her temerity, took it gingerly in his fingers—with the usual result. It bit him with a sharp plunge—only a scratch in the angle between the forefinger and thumb, just enough to draw blood; but he flung the poor whip-snake on the ground in fright and disgust, and began to nurse his hand.

'Do not be alarmed!' said the guest, with a smile; 'it is perfectly harmless. The snake's teeth cannot hurt you as much as the beak of yonder love-bird!'

Suddenly he seized the bitten hand and bent over it as though to inspect it closely; bent lower and lower, while a stifled silence fell on the group; lower and longer, till every heart throbbed audibly in the pausing moments. Then he slowly raised his head and lifted up a white ghastly face, the face of one changed by death.

'Senhor,' he gasped, with scarce articulate utterance, 'I have been deceived! The serpent is venomous, and in an hour you will have succumbed to its bite unless vigorous measures are taken. I have the antidote, a counter-poison proved by a hundred experiments upon myself. Submit yourself to me, and I will save you. Quick! there is no time to be lost. Though you feel nothing now, in a few minutes the poison will have taken possession of your system, and it will be too late. Lie down on the floor of the veranda instantly—do what I tell you—do nothing else!'

His speech cleared, and the blood flushed back to his lips again as the words poured forth in a mad torrent, and he rushed into the house where his preparations had been deposited. The victim, half incredulous, yet scared out of his senses, placed himself in a framework chair and lay back on its fold of jaguar-skin. His wife, with desperate calm, took a flask of Italia from the sideboard and poured its contents into a tall Venetian glass, for she had a dazed remembrance of having read or heard that large quantities of spirit were given to keep up the circulation of people serpent-bitten. She was just on the point of holding the vessel to her husband's lips, when their guest sped back into the veranda with two small boxes in his hand. In a perfect fury of excitement he dashed the glass aside with such violence that it was shattered in her grasp.

'Drink, and you are a dead man!' he shrieked vehemently. 'I say, do nothing but what I command, or I am powerless for your rescue. On the floor—quick, quick, on the floor, or you are lost!'

Like one possessed, he caught up the Englishman in his arms and threw him out of the chair upon the boards, while the poor girl, frozen with terror, stood by motionless as a statue, with the broken glass still in her unconscious hand, and her dress stained and splashed by the spirit. Down he knelt by the recumbent form, and drawing forth a lancet from a case of surgical instruments, he lightly scarified the skin of the hand in the neighbourhood of the scarce-visible bite. Then from the other box he took a tiny glass tube, fine almost as a hair, but containing a glistening streak of fluid. Steadying himself by a fierce repressive effort, and evincing a quietude and deliberation as unnatural as his previous frenzy,

he gently blew the minute drop of glutinous liquid out of the tube on to the point of the knife, and rubbed it into the bleeding scratches. A moment later his patient uttered a cry of agony, and the operator glanced swiftly upwards for one moment.

In that one moment she learned all. By the lurid flash of that one swift involuntary glance she read revealed in the figure kneeling at her feet her lover and her husband's murderer. Without a word, without a thought, impelled only by a blind protective instinct, she stooped and, with a wild thrust, pushed his head away as he hung over the poisoned hand. Never heeding him further as he reeled to his feet and, clasping his throat with both hands, staggered out into the air, she caught up the rapidly discolouring limb and sucked the wound in desperation to drain the veins of the death already creeping through them. That terrible cry had brought some of the slaves into the veranda, and by this time her father had reached her side. Medical aid was summoned, and stimulants were poured down the sufferer's throat, pending the arrival of the physicians. 'Snake-bite!' resounded on every side, and was enough to account for all.

Outside in the glory of the sunshine stood the Portuguese, leaning against a clump of bamboo in the garden, dead. The splintered glass which her hand had mechanically retained had struck him in the neck as she pushed him aside from his lethal work, penetrating his carotid artery, and he had bled to death in a few moments. I suppose some influence in high places and a sufficiency of *milreis* notes arranged what little was left between him and the concerns of the world. Anyhow, he was huddled into the ground the same night, and next day the *Jornal do Commercio* informed its readers that he had been killed by a gurenen.

Care, skilful surgery, and a grand constitution pulled the patient out of the fire, and he ultimately recovered perfectly as far as his general health was concerned, though he never fully regained the use of his hand and arm. There could be no doubt as to what had happened; but I believe that no one but the wife, her father, and myself ever shared with the victim the true explanation. The Brazilian doctors had naturally accepted without cavil the statement that the hand, which by the time they examined it had undergone such disfiguration as to mask any original fang-wounds, had been bitten by a venomous serpent which had escaped unidentified—for the little *Philodryas viridissimus*, the little green whip-snake, had made good its exit in the confusion and was seen no more. The description given of it, however, was unmistakable, and could not possibly be confounded with that of any poisonous snake; it is a species which lives chiefly in trees and bushes, feeding on lizards and leaf-frogs, and is very common in that region. I may add that on more than one subsequent occasion a similar specimen was recognised without a moment's hesitation by all those who had been brought in contact with the reptile in question—a creature absolutely destitute of fangs or poison-bags, and possessing less power of inflicting injury than a mouse. It may be that the whole train of events, seemingly fortuitous, was the result of a baleful forethought and design on the part of the

unhappy man. More probably, as it appears to me, he was innocent of any purpose until struck by the diabolical idea that the harmless scratch might be converted into a death-dealing catastrophe by the means which his pursuit of scientific investigations had placed at his disposal—an idea perhaps actually engendered by the fright and unreasoning fears of his dupe. But howsoever the horrible intent may have originated, it is certain that the matter contained in the tubule was the venom of one of the great viperine serpents which abound in the tropical parts of South America, most likely a rattlesnake. His collection at Paqueta included a large number of these crotalines, which I believe to be the most virulent serpents on earth; and that he stored the poison for experimental uses was proved by the circumstance that a considerable quantity of it was found amongst his drugs and chemicals, in dried scales and on blotting-paper and sugar, as well as in glass tubes. I discovered also a peculiarly shaped spoon, and some shells covered with vegetable parchment which had been prepared to receive the bites of the enraged reptiles, teased into striking, and so to collect the fluid ejected from their glands. And with this deadly virus he was deliberately and murderously infecting the lifeblood of the man whose salt he had eaten, when the love for which his soul was stained betrayed him.

Bless me, there goes six bells! Why didn't some of you bring me up with a round turn before? We shall have the quartermaster upon us presently to order the light out.—Fiver, if you mean to keep the middle watch with your eyes open, you'd better turn in for an hour all standing, or you'll be found on the wheel-gratings all dreaming of snake-bites.—I'm going up to sleep on the hurricane-deck skylights.—Good-night, all!

WOMEN WHO THREW AWAY CROWNS UNAWARES.

AT the commencement of his career, the Great Napoleon fell in with an ardent Revolutionist, M. Paul François Barras, who took a great liking to the young Corsican, and conceived the highest opinion of his abilities and of the powers which, events proved, he possessed in so remarkable a degree. But in the opinion of Barras, Napoleon's want of means was a most serious obstacle to his chance of achieving fame, and he proposed to remedy this by selecting for him a rich wife. Now, whether it was that he did not number among his acquaintances many women with the requisite *dot*, or whether he thought that his protégé's fiery youth would be the better for the restraining influence which a wife of some experience in the ways of the world would no doubt be able to exert, Barras chose for this position a woman, who, though still undeniably handsome, was no longer young. Though she was called Mademoiselle Montansier, she was in reality a widow, who, because she had been on the stage, had never adopted the name of her husband. She was sixty years of age; but it was said that she made herself appear to be not more than forty by the intimate knowledge that she possessed of the secrets of the toilet table.

Barras made up his mind that it was imperative to the success of Napoleon's career that he should make this elderly lady his wife, and accordingly he set himself to work to bring about the match by impressing upon each of them the advantages that would result from it. To Napoleon he dilated upon the power that would follow the acquisition of the wealth which Mademoiselle Montansier could give him; to the lady he enlarged on the position that his talented young friend was bound to make for himself, and that would of course be shared by his wife.

For the purpose of introducing the couple to one another, he decided upon giving a supper, to which they were both invited; he so arranged matters that they were placed together at the table, and hoped that this precaution, added to the injunctions which he had given Napoleon to behave for once in his life with some show of civility to a lady, would have the happiest result. But in this he was fated to be disappointed. Napoleon was quite the last man to rely upon in such a respect. His manners towards the fair sex were those of a costermonger, and though he could generally hold his own in a conversation with men, he was entirely without the knack of making himself interesting or agreeable to women. He felt that his place was in the camp or the field, and he was quite out of his element among the conventionalities of a *salon*. Had he been inclined to woo, it would have been in a straightforward soldier-like fashion, and not with the dailings and compliments so dear to the Frenchwoman of his time. So, presently, Barras had the mortification of seeing Mademoiselle Montansier, her back turned to Napoleon, engaging in a lively conversation with the gentleman on her other side, while the future conqueror was making with little pellets of bread a plan of a battle on the table before him. Hardly a word passed between the two during the remainder of the meal. Barras watched with growing annoyance the indifference of Napoleon, and felt his plans melting into thin air as he saw the evident delight with which the widow turned from him to the more entertaining companion she had found elsewhere.

Supper over, Barras drew Napoleon aside and spoke forcibly to him of the foolish way in which he was throwing away his chances. 'You know,' said he, 'that money is everything to you; here are a million francs, and you will not stretch out your hand to take them; a most attractive woman, and you will not show her the smallest gallantry. Mademoiselle Montansier has come here this evening prepared to hear a declaration from you; strike while the iron is hot, and win the wealth that you cannot do without at one bold stroke.'

'The woman is old enough to be my grandmother,' said Napoleon, who was then twenty-five years old; 'but that is no matter, for to me all women are alike. Money is what I want; and if I cannot get it without a wife, I must take the two together. I am no coiner of pretty speeches; but before the evening is over I will say to her: "Mademoiselle, are you willing to accept me as your husband?" More than that I cannot do.'

'The very kind of proposal that any woman would expect from a blunt soldier,' replied Barras.

'Say that, and I desire no more.' You are to be envied; for, besides her wealth, Mademoiselle is very handsome still.'

Napoleon turned away with a gesture of impatience; but half an hour later Barras noticed, to his joy, that the two were alone together in a recess. Presently, Napoleon got up and went away, and the lady beckoned to Barras with her fan. 'Take away that dreadful little man,' she said with a shudder; 'he has bored me to death, and I only prevented him from proposing by sending him for a glass of lemonade.'

'But why prevent him?' said Barras. 'He will be a great man yet.'

'Give myself and my money to such a little horror, such an ill-mannered boor as that!' replied Mademoiselle. 'Never! I would sooner take the first beggar-man out of the streets. What have I done that I should be given such a wretched evening? Don't let your'

But at this moment she was checked by the arrival of Napoleon with the lemonade. Barras hurried away, still hoping for the best; but soon he saw at the other end of the room Bonaparte standing in the attitude in which he has so often been depicted, with his arms folded and his chin sunk upon them.

'Well, are you to be married?' he said, hastening towards his protégé.

'That old actress,' said Napoleon, 'that female *Cæsar*, refused me before I had opened my mouth to ask her hand. I was on the point of speaking, as I told you I should speak, when she began to inform me that her wealth was the cause of her constantly receiving offers from adventurers who cared nothing for herself; that she thanked Providence she had so far seen through such fellows; and that she was resolved to keep her independence. I was glad I had not spoken, for it gave me the opportunity of saying: "Mademoiselle, pray persevere in that praiseworthy intention; it is one which I am sure no one will ever try to persuade you to alter."—Let her keep her millions to bait the hook for some one else; I have done with her.'

And in spite of Barras' endeavours, the affair ended there.

In after-days, Mademoiselle Montansier was fond of boasting that, had she chosen, she might have been Empress of France and wife of the most famous man of the age. Could she have been gifted with the faculty of foresight, no doubt she would have regarded more leniently the young man whom M. Barras wished her to marry.

When the people of Grenoble, in 1788, were preparing for the Revolution, Jean Baptiste Bernadotte, afterwards king of Sweden and Norway, was quartered in the town. At that time he was a simple sergeant, distinguished by the attention he paid to his military duties, by his skill at cards, and by his popularity with the fair sex. On the famous 'Day of the Tiles,' when the women of Grenoble mounted on to the roofs and assailed the troops with a storm of tiles, Bernadotte was with his regiment in the Rue Pertuisière. There were cries from one housetop to another to spare the popular sergeant; but in spite of the good intentions of the assailants, he received a blow on the head which stretched him apparently lifeless on the ground. But presently he showed some signs of life, and was carried into a neigh-

bouring café, where he was laid upon a table which is shown to this day. A surgeon was called; and the wounded man showed such signs of vitality under his treatment, that it was soon evident that he was preserved for some other fate than that of Pyrrhus. As he recovered his senses, he slowly raised himself on one elbow, and looking at the faces crowded in the doorway, was attracted by one, that of a beautiful young girl, whose big blue eyes were suffused with tears of pity for him. But faintness overcame him, and when he again recovered, the sympathising face was gone.

Bernadotte was not long in getting over the effects of the blow that had prostrated him; and when he was quite recovered, he lost no time in endeavouring to find the maiden whose face he remembered like that of some pitying angel. For weeks his search was all in vain; but one day, as he was walking along and trying in vain to persuade himself of the futility of his search, he raised his eyes, and there before him was the face which had haunted him for so long! The girl walked past him without recognising the wounded sergeant of the 'Day of the Tiles.' He followed her, and entering her home, made himself known to her parents, and offered himself as a candidate for the hand of their daughter.

At first the fair Amelie was well enough pleased to receive the attentions of the smart young soldier; but after a while, a rival suitor appeared on the scene, and as he was the owner of a watchmaking establishment that yielded a comfortable income, his protestations of love sounded sweeter to her ears than those of the penniless *sous-officier*. At last the day came when Bernadotte was met on the threshold by her mother, who informed him that Amelie had the evening before betrothed herself to the watchmaker. His fury knew no bounds; and rushing from the house, he sought his rival and challenged him to a duel. The civilian was no coward, and they met the same evening; but the watchmaker was no match for Bernadotte, who was considered one of the crack swordsmen of his regiment, and after the exchange of a few passes, he fell with a severe wound in his side. The victorious soldier hoped that now Amelie would listen to his suit; but when he told her what had happened, she railed at him as the murderer of her lover, and told him never to let her see his face again. In six weeks' time she became the bride of the man who had braved death for her sake, and soon afterwards Bernadotte left Grenoble and began the career that landed him upon a throne.

When he was occupying a palace and directing the affairs of a nation, his old lover Amelie was a wrinkled, decrepit old woman, the general drudge of a wayside inn. Ill health had come upon her husband, and though she had struggled bravely to tide over the bad times by taking in washing, she had not been able to make headway against the evil fortune which pursued them. Her husband died, and she sank to the lowest level of dependence.

She was fond of relating the story of her earlier days, and used to say: 'Ah, sir, I should have done much better in marrying Monsieur Bernadotte. Why, I should have been a queen now—yes, a queen, instead of a drudge at every one's beck and call. Ah! I made a sad mistake; for

I assure you, sir, that Monsieur Bernadotte was no common man, and I always had a presentiment that he would distinguish himself. But when we are young we do not reflect, though I do not think that many can have been punished for their thoughtlessness by the loss of a kingdom.'

All remembrance of her husband's devotion seemed to have been driven from her head by brooding over the grand position she might have occupied had she refused him; though it is probable that if she had married Bernadotte instead, he would have settled down to a humdrum life, and would never have achieved greatness but for the recklessness which Amelie's refusal of him engendered. When asked if she had ever heard from him she replied: 'No, sir. I have written to him several times since he became a king, but he has never answered my letters. Perhaps he is still annoyed at my having refused him. If I had any money, I would go to Sweden and beg him, for the sake of the love that he once had for me, to give me his linen to wash! He would hardly refuse that.'

What an illustration of the workings of fate! The woman who might have shared Bernadotte's throne longing for his washing, and prevented from obtaining even this by her extreme poverty.

CHRISTMAS HOLLY.

The round bright sun in the west hung low;

It was old-fashioned Christmas weather.

I remember the fields were white with snow

As we stood by the stile together.

In the woods the berries grew thick and red;

Yet I lingered and called it 'Folly!'

When you said with a smile: 'Let us cross the stile

And gather some Christmas holly.'

But over the fields by the frozen brook

We went where the boughs were sprinkled

With snow; and deep in a sheltered nook

The waterfall faintly tinkled.

A brave little robin sang out in the cold:

It was only young lovers' folly,

But we listened so long to the redbreast's song

That we almost forgot the holly.

Then the light died out of the golden day,

And the moon showed her silvery bow,

And we never knew if our homeward way

Lay through rose-leaves or drifted snow.

One bright star shone in the pale clear sky;

And my mother said it was folly

To listen so long to a robin's song—

But we brought home the Christmas holly.

You stir not now from our ingle nook,

And my hair is white like the snow;

For the story you told 'mid the sunset gold

Is a story of long ago.

As hand clasps hand by the winter fire,

Do you deem it an old wife's folly

That my eyes grow wet with a sweet regret

When I look at the Christmas holly?

THE BAHAMA FIBRE INDUSTRY.

As efforts have been made of late to bring into notice a hitherto little-known dependency of England, the Bahama Islands, with a view to the development of the Fibre Industry, for which its soil renders it especially suitable, it may perhaps interest our readers to learn some particulars of these islands from one who has long resided there.

When, some dozen years ago, we stated to our friends our intention of going to the Bahamas, it was amusing to note the various ways in which our announcement was received. The greater part in blank amazement asked, 'Where are the Bahamas? We never heard of such a place.' Others hearing mention of Nassau, the capital, immediately relegated us to Germany, and assured us it would be extremely cold for a winter residence. Others, again, confounded it with the Bermudas, and spouted Moore's song of the bulbul. One, a sea-captain, whose wanderings had led him to America, gravely shook his head, and warned us that we were going to an extremely wicked place, a community of wreckers; and so forth.

Notwithstanding all this ignorance on the part of those who must certainly have learnt in their school-days that the Bahama or Lucayos Islands are the most northerly group of the West Indies, lying off the coast of Florida, U. S. A., we found on our arrival at Nassau that the Bahamas have a history. They are of no mushroom growth, the offspring of gold-fields and diamond mines. They were discovered by Columbus, whose more than life-size statue guards the flight of steps to Government House; and these islands were to him the forerunners of the New World. One of them long enjoyed the reputation of being that on which he was saved from shipwreck, hence named by him San Salvador; but modern ideas have transferred that honour to Watling's Island. The Bahamas were discovered in 1492; and the present island of New Providence received from Columbus the name of Fernandino, in

honour of his sovereign. But in the splendour of their after-conquests the Spaniards forgot the Bahamas, and they were rediscovered nearly two hundred years later by Captain Sayle, an English navigator, on his way to Carolina in 1667. He gave the name of Providence to the island on which he was wrecked; and finally, to distinguish it from another place of that name, it was called New Providence. The Bahamas were annexed to England, and in 1672 a governor was sent out to settle the new colony.

But during the nearly two hundred years since its abandonment by the Spaniards, the Bahamas had become the headquarters of pirates, for whom its dangerous and intricate channels and endless islets and creeks rendered it a safe hiding-place; and these outlaws sorely troubled the early days of the colony; and made the lives of the governors a burden to them. At length, under the leadership of one Black Beard, they became so intolerable that an English force was sent to suppress them.

The Spaniards looked with some jealousy on the improved condition of a colony so near their own possessions, and during the American War of Independence seized upon them. The ruins of a strongly built Spanish fort are still to be seen choked up with bush at the west end of the island of New Providence; whilst two others, Fort Charlotte and Fort Montagu, are still in good condition. Spanish gold hoards, doubtless of the pirates, have been found at various times. At the close of the war, the Bahamas were retaken by the gallantry of a young English naval officer named Maynard; and for many years the colony prospered, as may be seen by the remains of country-houses in the different islands now going to ruin. On the abolition of slavery, the owners, unable to cultivate their large tracts of land, in many cases abandoned them to their slaves, and much of it has returned to bush.

No one in those days paid much attention to the Sisal plant (*Agave sisilaria*)—of which more than one species grows wild—except to regard it as a troublesome weed which no amount of hard

usage could exterminate. It was only some few years ago that its value was discovered, and a few enterprising men turned it to some account for rope-making. It is especially valuable for ship cables, as it has been found to resist the action of sea-water better than most materials used for their manufacture. To convey a general idea of the appearance of the plant, one may say it is something like an aloe, but grows to a very large size, some of the leaves from which the fibre is extracted being six feet long with sharp points at the end; others have hooks all down the sides. There are seven different kinds of Sisal, some of which are valueless, but all yield a fibre. The Sisal plant has been grown for many years at Yucatan, a barren and rocky coast, with great success, and brings large profits, as, once planted, it spreads rapidly and needs little care. The soil of the Bahamas is said to be even more suitable for its growth than that of Yucatan. The plant grows wild, and all that is required for its cultivation is to clear some land—the more rocky the better—then plant young shoots in rows of about twelve feet apart, with a path between of about eighteen feet, to allow for growth and for carts to pass between. This work can be done by women at ninepence a day.

As the plant requires at least three years to reach perfection, it is necessary for all who embark in its cultivation to have something to fall back upon, either a small income or some occupation to support them until the plants have reached maturity. This might be found in growing fruit and vegetables, for which there is an opening. The market is not well supplied, the greater part coming from the out-islands. Bananas, oranges, shaddock, limes, mangoes, nammee, sappadillo, sour-sop, avocado pear, bread-fruit, guavas, melons, pine-apples, sugar-apples, and cocon-nut are the chief fruits. Potatoes both sweet and Irish, yams, cassava, various kinds of pea and bean, okra, tomato, pumpkin, with some English vegetables—lettuce, cabbages and turnips, carrots, parsley and thyme, will all grow with care in the winter season; but in consequence of the long droughts which often prevail, some system of irrigation, such as is adopted in India, is very necessary. The black people can scarcely be considered a docile race, at least as compared with Hindu coolies, nor are they so industrious. They seem to have an idea that it is a flying in the face of Nature and of Providence to water. But, fortunately, a drought rarely prevails over all the Bahamas at once, and therefore in the winter season New Providence depends mainly on the out-islands for fodder for cattle and horses. Oats and hay are imported from America for the favoured few; but the general run of horses and mules have to learn to feed on blades—the leaf and stalk of Indian corn—on the corn itself, and on Guinea-grass; whilst in times of scarcity they have to fall back on the boughs of various kinds of trees—pride of India, mastic, Sydney-cod, and jumby; but as this last causes the hair to drop from the tail and mane, it is generally forbidden to horses.

New Providence is by no means the largest of the Bahama Islands, of which, including all the cays or rocky islets, there are some six hundred. Only from eighteen to twenty are inhabited,

some entirely by blacks, a few chiefly by whites. Andros, sixty miles from New Providence, is considerably larger and well wooded. Eleuthera and Abaco, long narrow strips of land, and Cat Island or San Salvador, are the chief pine-growing islands. Exuma and Inagua have wild horses, and rear most cattle. But New Providence is more conveniently situated for trade, having a good harbour. It is slightly larger than the Isle of Wight, being twenty-seven miles long by fourteen wide, lying east and west. Nassau, the capital, is the only town, and has a cathedral and a bishop's residence. There are settlements in many of the out-islands. Nassau harbour is formed by a long narrow strip of land which runs parallel with the shore for two or three miles, called Hog Island. As you cross the bar and get beyond the reach of the Atlantic billows the calm is instantaneous. The colour of the water itself changes; a lovely transparent green blue takes the place of the indigo waves outside. This lovely sea of ever-changing, ever-beautiful tints is one of the great charms of Nassau. An English sea looks leaden and colourless after these supphire waters, which, whether lashed by storms or in dead calm, look equally beautiful.

Nassau itself is a clean little city, with a principal street running along the shore. No smells suggestive of yellow fever greet the nose on landing, as at Cuba and Jamaica; but neither are there any grand mountains suggestive of earthquake to enchant the eyes. The Bahamas are sadly flat, as befits their coral formation. Some two or three of the islands boast of hills; one has an approach to a river. New Providence contains two lakes, both brackish; but plenty of excellent water can be found almost anywhere by digging, and there are wells to almost every dwelling-house. Rain-water kept in tanks is chiefly used for drinking. The whole island is a well with a shallow layer of soil; the yearly deposit of leaves is a priceless treasure, and even weeds are rarely burnt by the thrifty, though bush-clearings are generally done by fire. It is a question whether this mode of agriculture does not impoverish the ground.

Considering the lack of soil, it is surprising that the trees in these islands attain to the size they do. There is a great variety of them, and some are very large. The roots of many spread along the ground to great distances, and these, such as the tamarind tree, are easily overturned by hurricanes; but so tenacious are they of life, that in this prostrate condition they throw out new roots and continue to thrive. Others root themselves in crevices of the rock, striking downwards till they reach water, which is never very far below. Others, again, such as the ceiba or silk-cotton tree, throw out large buttresses from their stems to make up for depth. One growing in the centre of the public buildings at Nassau could accommodate several horses with separate stalls. The chief trees are the cocon-nut palm, tamarind, ceiba, sandbox, horseflesh (a species of mahogany), gumalany, logwood, and three kinds of fig or banyan. The ponsiana, a very handsome tree with flaming masses of blossom of a brilliant scarlet, was introduced from Demerari, and for many months of the year brightens the island with its splendour.

In the centre of the island is a fir forest, or, as here called, 'pine barren,' the resort of wild pigeons—almost the only game, except a few water-birds—coot, and wild-duck. The birds in New Providence are not remarkable, though numerous in the winter season, when they migrate in large quantities from America—humming-birds, banana birds, and various kinds of small parakeets; ricebirds, American robin, mocking-birds and thrashers, the last resembling in note the English thrush. In the out-islands small parrots are still found.

Unfortunately, there is no botanic garden in Nassau. Gardening is a laborious work, owing to the winter droughts. The bush contains a great variety of pretty flowering shrubs, and about seven varieties of ferns, and the same of orchids. Most of the cultivated shrubs and flowering trees have been introduced from time to time from Cuba and other parts of the West Indies. Cinnamon and spice grow here, but are not turned to use. A profusion of roses, lilies of various kinds, hybiscus, plumbago, geraniums, with some English seedlings, grow luxuriantly; but hurricanes, though not frequent, are very destructive, and help to keep down a population already poor. It will be a great blessing to the Bahamas if the Sisal-planting succeeds, as it requires but little soil and is not injured by weather.

The stores in Nassau are so much improved that really for all moderate wants they suffice. It is a mistake to try to make a colony like England. Epicures and highly fashionable folk should never leave its shores, for it must be confessed that—guava jelly and West Indian preserves excepted—food in a tropical country is not luxurious, certainly not in the Bahamas; but the necessities of life are cheap and abundant. It would be a philanthropic, but, considering the nature of the black race, a difficult work to set on foot a school of cookery, and the teacher would need first to master the primitive style of pots and pans. No iron-ranges here; coal as we know it is a thing unknown, except in the *Victoria Hotel*. Charcoal goes by that name here, and wood-fires are universal—a source of perpetual heartburning between mistress and cook. It would be well for an intending visitor to have some knowledge of *cuisinurie*, for the race of cooks is dying out fast, the few remaining being relics of 'old-time days.'

Amusements truly are few in Nassau. The one or two English ladies ride. As regards horses, 'handsome is as handsome does;' *ergo*, Nassau horses are very handsome; they do their duty nobly. A Nassau horse never walks; it is always at full tear, and this on hard roads cut out of solid rock. Dogs are legion; a handsome dog is a curiosity; their concerted barking on moonlight nights, together with the crowing of innumerable roosters, drive slumber far away from weary eyes. In all other respects moonlight nights in Nassau are heavenly. It would be a good work to import a little new blood in the way of dogs; the present race of curs is deplorable. Bouting as an amusement is scarcely made so much of as it ought to be; and fishing is almost confined to the trade. Yet fish about the Bahamas are very abundant, various, and extremely beautiful, and form the staple diet of the poorer classes. They are of all colours and

sizes; some of a deep royal blue, some cherry coloured, some silvery spotted with red or striped with yellow, and most of them good eating. Crayfish, crabs, and turtle also abound. Picnics by land or by water are frequent in the winter season.

In closing these few remarks on the Bahamas we must not fail to extol the climate, which scarcely has its equal in any part of the world. Hitherto, this has been its one recommendation, its sole stock in trade; let us hope that Sisal may prove an additional one; but of the two, health is better than wealth, and it is not too much to say that to live is a pleasure in the Bahamas. A more charming climate does not exist, and one only regrets that its distance from England prevents its being more frequented by invalids from thence. It is delightful to wake up day after day to bright sunlight; and it is only when you return to the dear old mother country with its gray skies and tedious winters that you fully realise the charm of a climate like this; free from all epidemics which linger more or less in all the more beautiful southern isles, with a winter lasting from October to May, during which the thermometer never falls below fifty-six degrees, rarely below sixty. Our American neighbours discovered its value long ago, and for many years have made Nassau their winter resort, many hundreds coming in relays to the *Victoria Hotel* and to other boarding-houses. Their arrival is the signal for such festivities as the island affords; and to their cheerful and genial disposition the Nassovians are not a little indebted for the brightening of their somewhat monotonous life. In fact the great want of these islands is a little more intercourse with the outer world, a little more public opinion, a little shaking out of old grooves, and a little of the large-mindedness which comes from rubbing up amongst our fellow-creatures and from a knowledge of other countries. If they have not all the luxuries of other lands, they have a climate which is a luxury in itself, and which renders many others unnecessary.

Let us hope that the Sisal plant may fill its empty coffers (we have heard that a ton of fibre which was lately sent to England from the Bahamas realised fifty-two pounds), and that it may be found after all that the despised weed is better than Spanish gold; and that a bountiful Providence leaves no spot destitute of resources if diligently sought for and improved.

A DEAD RECKONING.

CHAPTER XVIII.

JULES PICOT had been carefully searched before being locked up in his cell, and it was an utter puzzle to the jail officials how he had contrived to conceal about him even so insignificant an article as the tiny phial of poison so as to evade detection. One of the warders, however, of a more inquiring turn of mind than his fellows succeeded, a day or two later, in solving the mystery. The mountebank wore very high-heeled shoes, as many of his countrymen make a practice of doing. The heel of one of his shoes had been so made that it could be unscrewed at will, while inside it was a cavity just large enough

to hold the phial. Picot had evidently prepared himself beforehand for a contingency the like of that which had at length befallen him. The letter written a few hours before his death was in French, and was addressed to 'Madame Brouke.' The following is a translation of it:

MADAME—When these lines reach you, the hand that writes them will be cold in death. I am tired of life, and life is tired of me: this night we part company for ever. I take the liberty of addressing you because of your kindness to my little Henri (whom *le bon Dieu* has seen fit to take from me for my sins), and because you were so much in his thoughts when he was dying. I also address you for another reason, which I will explain presently.

It was in the first week of the new year that Henri met with the accident which proved fatal to him. He lingered for two weeks, and then died. He had but little pain; life faded out of him like a lamp that slowly expires for want of oil. As I said before, he often talked about his *belle madame*. He could not remember his mother, and it was your face that shone on him in his dreams, as it were the face of an angel.

After he was gone and I was alone in the world, I, too, began to have dreams such as I had never had before. Every night Henri came and stood by my bed, but it was always with an averted face; never would he turn and look at me. I used to try to cry out, to seize his hand; but I was dumb and motionless as a corpse. Then, after a minute or two, he would slowly vanish, with bowed head and hands pressed to his face, as though he were weeping silently. Night after night it was ever the same. Then a great restlessness took possession of me. I seemed to be urged onward from place to place by some invisible power and without any will of my own. When I rose in a morning I knew not where I should sleep at night; onward, ever onward, I was compelled to go. Last night I reached this place, and this morning I rose thinking to resume my wanderings; but a conversation I chanced to overhear led me to seek the court of justice. You, madame, know what took place there.

Even before I had spoken a word, I knew why my footsteps had been directed to this place, and that my wanderings were at an end. This afternoon, after all was over, I lay down on my pallet and fell asleep, and while I slumbered, Henri came to me; but this time his face was no longer averted; his eyes gazed into mine, and he smiled as he used to smile at me out of his mother's arms. Ah, how shining and beautiful he looked! Then a soft cool hand was laid on my brow, that had burned and burned for months, and all the pain went, and I knew nothing more till I awoke.

A word more and I have done. Madame, pray believe me when I say that never could a man be more surprised and astounded than I, Jules Picot, was to-day when I found that it was your good husband who was accused of the death of the Baron von Rosenberg. When I made my way into the court after hearing that some one had been arrested for the murder, I thought to see only a stranger, one whom I had never

seen before. But even in that case I should have done as I did to-day, and have confessed that it was by my hand and mine alone that Von Rosenberg met his death. Conceive, then, my astonishment when in the accused I recognised M. Brouke, whom I had known in London under the name of 'M. Stewart.' I knew that when in London he was in trouble—in hiding—but never did I dream of the crime that was laid to his charge. Had I but known it, you and he would long ago have been made happy by the confession of him who now signs his name for the last time.

JULES PICOT.

With what a host of conflicting emotions this document was read by her to whom it was addressed may be more readily imagined than described.

George Crofton sat alone in his cell, devouring his heart in a bitterness too deep for words. All was over; all the bright prospects of his youth and early manhood had ended in this; his home for years to come would be a felon's cell, his only companions the lowest of the low, the vilest of the vile. '*Facilis est descensus Averno*,' he muttered with a sneer. 'Yes, in my case the descent has been swift and easy enough in all conscience.' One gleam of lurid joy, and one only, illumined the black cavernous depths in which his thoughts, like fallen spirits, winged their way aimlessly to and fro, finding no spot whereon to rest. Gerald Brooke, the man he hated with an intensity of hatred bred only in natures such as his, was a prisoner even as he was, and it was his, Crofton's, hand that had brought him there! He had but spoken the truth when he said that the hour of his revenge would come at last. It was here now, although it had come after a fashion altogether different from what he had expected. Thanks to his folly, his own outlook was a dreary one enough; but what was it in comparison with the grim prospect that stared his hated cousin so closely in the face! When he thought of this it was as the one sweet drop in the bitter cup which Fate had pressed with such unrelenting fingers to his lips.

While he sat brooding over these and other matters, just as daylight was deepening into dusk, a warder unlocked the door of his cell. 'You're wanted in the waiting-room,' said the man. 'Your uncle, Colonel Crofton, has called to see you. It's past the hour for visitors; but as he's brought a magistrate's order, and as he says he's obliged to go back to London to-night, the governor has agreed to relax the rules for once.'

Crofton stared at the man in stupefaction. To the best of his belief he had no such relative in the world as the one just named. 'Ah, you didn't expect to see him, I daresay,' continued the warder. 'A nice affable gent as ever I see; but I wouldn't keep him waiting if I was you.'

Crofton followed the man without a word; and after being conducted through a couple of corridors, was ushered into a sparsely furnished white-washed room, where a middle-aged, well-built man of military carriage, who had been perusing through his eyeglass the printed rules and regulations framed over the mantel-piece, turned to greet him. He had close-cut grizzled hair and a thick

drooping grizzled moustache. He wore a lightly buttoned frockcoat, gray trousers and straps, and military boots highly polished. He carried his hat and a tasselled malacca in his hand, and one corner of a bandana handkerchief protruded from his pocket behind.

'My dear nephew—my dear George!' he exclaimed with much effusion as he advanced a step or two and held out his hand. 'This is indeed a dreadful predicament in which to find you. What, oh, what can you have been about that I should have to seek you in a place like this! Your poor aunt will be heart-broken when she hears of it. I must break the terrible news as gently as possible; but really, really, in her delicate state of health I dread the effect such a disclosure may have upon her.' His voice trembled with emotion; he brushed away a tear, or seemed to do so.

George Crofton had undergone many surprises in his time, but never one that left him more dumfounded than this, for in his soi-disant uncle his quick eyes recognised at a glance no less a personage than Lardy Bill. If at the moment his eyes fell on him he had been in the least doubt of the fact, that doubt would have been dispelled by the expressive wink with which his friend favoured him an instant later. The man's audacity fairly took Crofton's breath away.

'The first question, my dear boy,' resumed the shun colonel, so as to give the other time to recover himself, 'of course is whether anything can be done for you, and if so, what. I need not say that my purse is at your service; for, shocked as I am to find you in this place, I cannot forget that you are my brother's son. I leave for London by the first train, and immediately on my arrival I will take the advice of my own lawyers in the matter, which will, I think, be the best thing that can be done under the painful circumstances of the case.'

'I suppose that's about the only thing that can be done,' answered Crofton, who was still utterly at a loss to divine the motive of the other's visit.

The warder who had conducted Crofton from his cell was present at the interview, ostensibly for the purpose of seeing that none of the jail regulations were infringed either by the prisoner or his visitor; but a sovereign having been pressed into his reluctant palm at the moment he ushered the latter into the waiting-room, he now discreetly turned his back on the pair and stared persistently out of the window.

A little further conversation passed between uncle and nephew, the chief part of it falling to the lot of the former, then the colonel looked at his watch and rose to take his leave. The warder turned at the same instant.

'As I remarked before, my dear George,' said the uncle as he clasped both the nephew's hands in his, 'however pained—most deeply pained—I may be, everything shall be done for you that can be done. I refrain from all reproaches—at present I can only grieve. But your poor aunt, George—your poor aunt! You are her godson and favourite nephew. Ah me—ah me!'

He walked out of the room with both hands outspread and slowly shaking his head, like a man whose feelings were more than he could control.

The jail officials at an early hour next morning, in addition to making the discovery that in the course of the night their French prisoner had taken leave of them after an altogether illegal and unjustifiable fashion, were further astounded by finding that the inmate of cell No. 5 had also relieved them of his presence, but in a mode altogether different from that which had found favour with the mountebank.

Crofton, unheard by any one, had contrived to file through the middle bar of his cell window and then to squeeze himself through the aperture thus made, after which there was nothing but a high wall between himself and liberty. Beyond this wall were some market gardens, the jail being situated in the outskirts of the town, and then the open fields. Outside the wall, a coil of rope with a strong steel hook at each end was found; and the footsteps of two if not of three men were plainly traceable for some distance in the soft mould of the garden. As to how Crofton had become possessed of the file, and by whose connivance and help he had been able to climb the wall and descend safely on the other side, there was no evidence forthcoming. The only fact the jail officials could affirm with certainty was that their prisoner was nowhere to be found.

At as early an hour as possible on the morning following his capture, Crofton had obtained permission to send a telegram to his wife, and before noon Stephanie was speeding northward by the express in response to his summons. When she reached Cumberhays, it was too late for her to visit her husband that night; so, carrying her little handbag, she walked from the station to the inn nearest to it and asked to be accommodated with supper and a bed. She had ascertained from a constable in the street that the earliest hour at which visitors were admitted to the jail was ten o'clock.

Next morning, which was that of Saturday, Stephanie re-betines. While she was eating her breakfast the landlady bustled in, carrying an open newspaper. 'Here's the weekly paper, ma'am,' she said. 'The boy has just brought it; and as it contains a long account of the doings at the justice-room yesterday, about which you may have heard, I thought that perhaps you would like to read it over your breakfast.'

'Thank you very much; I shall be glad to do so,' said Stephanie quietly. She had given no name at the inn, and the landlady had not the slightest suspicion that her guest had any reason for being more interested than any stranger might be supposed to be in the news contained in the paper. Nor, in fact, had Stephanie any knowledge of what had happened. Her husband's telegram had been of the briefest; it had merely said: 'I am in trouble. Come at once. Bring money. Inquire for me at the jail.' But from what she knew already, she guessed, and rightly, that the enterprise on which Crofton was bent when he left home had failed, and that by some mischance he himself had come to grief.

The moment she was left alone Stephanie opened the paper with eager fingers. Her quick eyes were not long in finding the particular news of which they were in search. She read the story of the attempted robbery, as detailed in the evidence, with ever-growing wonder—a wonder that was intensified twenty-fold when she read how

Gerald Broöke had been arrested at the same time as her husband, and by what strange chance the two cousins had once more been brought face to face. But when, a few lines lower down, her eyes caught sight of another well-known name, all the colour ebbed from her face, leaving it as white as the face of a dead woman. She read to the end, to the last word of Picot's strange confession before the magistrates, and then the paper dropped from her hands.

'My father the murderer of Von Rosenberg, and I—I the cause of it!' she murmured in horror-stricken accents. For a little while she sat like a woman stunned, stupefied, her eyes staring into vacancy, her mind a whirling chaos in which thoughts and fancies the most bizarre and incongruous came and went, mixing and mingling with each other in a sort of mad Brocken dance, all the elements of which were lurid, vague, and elusive.

How long she sat thus she never knew; but she was roused by the entrance of the landlady, who had come to reclaim the newspaper, there being three or four people in the taproom who were anxious to obtain a glimpse of it. Fortunately, the good woman was somewhat short-sighted, and perceived nothing out of the ordinary in her guest's appearance or demeanour. But her entrance broke the spell and served to recall Stephanie to the realities of her position.

For a little while all thought of her husband had vanished from her mind. This second blow had smitten her so much more sharply than the first that the pain caused by the former seemed deadened thereby. But now that her waking trance was broken, the double nature of her calamity forced itself on her mind. 'My father and my husband shut up in one prison!' she said to herself; and it was all she could do to refrain from bursting into laughter. For are there not some kinds of laughter the sources of which lie deeper than the deepest fountains of tears?

Suddenly she started to her feet and pressed both hands to her forehead. 'But why—why should my father have gone to Von Rosenberg to demand from him tidings of me, when I wrote to him from London telling him all that had happened to me and where I was? Can it be possible that my letter never reached him? Had he received it, there would have been no need for him to seek Von Rosenberg. Even after so long a time I could almost repeat my letter word for word. In it I told my father how I had left home with Von Rosenberg, but only after he had given me his solemn promise to make me his wife the moment we set foot in England. I told how, within an hour after our arrival in London, I had claimed the fulfilment of his promise, and how he had laughed me to scorn, thinking that he had now got me completely in his power. I told how I flung all Von Rosenberg's presents at his feet and left him there and then, and going out into the rainy streets of the great city, fled as for my life. I told how I hid for weeks in a garret, living on little more than bread and milk; and how at last, when my money was all gone, I found my way to the nearest cirque, and there obtained an engagement. All this I told my father in my letter, and then I prayed him to forgive me, and told him how I longed to go back to him and my mother. Weeks and months I

waited with an aching heart for the answer which never came. Then I said to myself: "My father will not forgive me. I shall never see him or my mother again." But the letter never reached him. Had it done so he would not be where he is to-day.' Tearless sobs shook her from head to foot.

At this juncture in burst the landlady with an air of much importance. 'As you have read the paper, I thought that maybe you would like to hear the news that one of the warders just off duty has brought us from the jail. Such times as we live in, to be sure!'

'News—what news?' asked Stephanie faintly. 'John Myles has brought word—and he ought to know, if anybody does—that one of the prisoners—Crifton or Crofton by name—managed to break out of his cell in the night, and has got clear away. But that's not all by any means. The foreigner—him as accused himself in open court of the murder—was found dead this morning, poisoned by his own hand. The news will be all over England before nightfall.—Gracious me, ma'am, whatever is the matter!—Mary, Eliza—quick, quick!'

THE TOURACOS AT THE ZOOLOGICAL GARDENS.

At the present moment the Menagerie of the Zoological Society, Regent's Park, has an unusually large number of Touracos, a species of birds which has not before been exhibited in this country. Touraco is the native name of a beautiful group of birds peculiar to Africa, and sometimes called, from their food, Plantain Eaters. They are generally supposed to be allied to the Cuckoos, and they are not altogether unlike some of them in their external characters. An African traveller observed so long ago as 1818, that the Plantain Eaters during heavy showers hide themselves in the thickest foliage, as if they had a special dread of getting wet. There is nothing particularly remarkable about this; in fact, many birds show a dislike to getting wet feathers; but the Touracos have a much better reason for this dislike than most other birds. M. Verreaux, the traveller referred to, discovered the reason when he attempted to catch a Touraco which was sheltering itself during a storm of rain: he found that, when he grasped the feathers, the brilliant crimson colouring-matter stained his hands; and later, he discovered that the feathers could be washed almost white. To find colours that 'run' in the feathers of a bird is most unexpected, and it is not surprising to hear that one naturalist who purchased some skins thought himself to have been deceived with artificially painted birds. The colour comes out so readily that when a Touraco is shot and falls into a pool it stains the surrounding water not so much with its blood as with the red dye from its wing feathers. Touracos are not, however, entirely coloured by this peculiar substance; they have a great deal of green about them, and this green is due to the presence of a green pigment which appears to be convertible into the red substance by prolonged boiling. The green pigment, unlike the red, is a 'fast' colour.

Most birds that are coloured green owe this colour, at least partly, to fine markings upon the

feathers; and all 'metallic' colours, such as the brilliant greens, blues, and reds of the humming-birds, are due to optical effects caused by the structure of the feathers, and have nothing to do with any pigment of the same colour within the substance of the feathers. There are thus two sources of colour among birds, and it is a remarkable fact that in many cases where the male birds have a brilliant coloration and the females are soberly clad, the colour is a 'mechanically' caused colour; for instance, in the humming-birds. The Touracos do not show this difference between the sexes; the female resembles her mate, and there is no superiority on either side, but an absolute equality.

What, then, in the first place, can be the advantage to the Touraco of having this brilliant and diverse coloration; and in the second place, why is the red colour so easily destroyed? It is no use nowadays to fall back upon the convenient statement that tropical birds are generally brightly coloured; this in the eyes of most naturalists would be as bad as to tell a physicist that mercury rises in an airless tube because 'Nature abhors a vacuum.' Everything has to be explained, and, moreover, the locks which guard the secrets of Nature have to be opened by keys of a particular pattern, either by skill or by force. In fact, there is a tendency to make one brilliant theory, applicable possibly to the instance which it was advanced to solve, do for all the phenomena which have any visible relation to it. But there is now to some extent a reaction against all this, and some naturalists think that we cannot and need not find a utilitarian explanation for every observed fact. It has been suggested that the red coloration of the Touraco is destroyed by the wet when the bird creeps into shelter, so that its enemies, which are driven by stress of weather into the same shelter, may not see it so easily. This is perhaps a little far-fetched, though ingenious. Another possible explanation is that the Touraco was originally an inhabitant of rainless or comparatively rain-free districts; but then, why should it migrate into districts where its colour was liable to be destroyed? This objection might of course be met by supposing that it is only comparatively recently that this migration has taken place, so that the bird has not had time to adapt itself to its new conditions. But all this assumes that the crimson colour has some definite bearing upon the mode of life of the Touraco. Colour cannot always have a relation of this sort, or else why should so many animals which inhabit the bottom of the ocean, where the darkness must be almost such as can be felt, be often brightly, nay, brilliantly coloured? It is the rule and not the exception for this brilliant coloration to occur in deep-sea animals; if any one doubts it, let him read Moseley's *Naturalist on the Challenger*. 'Bright scarlet shrimps, deep purple holothurians,' blue crustaceans, starfish, and sponges have been dredged up from a very remarkable darkness.

Now, it is a very remarkable fact about the Touracos that the red colouring-matter contains a large amount of copper. The existence of copper is not remarkable, for we know that this metal in minute quantities is most widely distributed in animals and vegetables: it occurs in cereals, eggs, and even in human blood; it is probably absorbed from the soil by plants and transferred to the

bodies of animals which feed upon these plants. But copper is so abundant in the feathers of the Touraco that the characteristic green flame is given when the feather is burnt. It is only in the red feathers that the metal is found. It seems, therefore, as if at least the greater part of the copper taken in with the food ultimately found its way to the red feathers. Perhaps, therefore, the solubility of the red pigment in water is a way of getting rid of the copper, which would otherwise accumulate in other parts of the body to a dangerous extent.

CHARLIE RANSOM.

A STORY OF THE OIL COUNTRY.

CHAPTER III.

ONE afternoon, about the 1st of March, Charlie Ransom's place at the little schoolhouse was vacant, and it soon became known that he was ill. The next day he was so much worse that Steve Smiley was despatched with his buck-board for Doctor Leslie, whose headquarters were at Mesopotamia Cross Roads. The physician pronounced Ransom's sickness a case of brain-fever; and although the lad had gone no further in his studies than the average boy of twelve in a London Board School, there was little doubt that close application to his books and an earnest desire to excel had engendered the fever. Perhaps there was something else which had worried Charlie; but that is a matter of doubt; and even if it were so, not a man or woman in Pan Handle City would have bracketed an affair of the heart with brain-fever in one and the same breath.

Charlie's winter-quarters were in the house of the owner and commander of the *Petroleum Gem*, who in winter took back, for board and lodging, part of the wages which he paid his first-mate during the summer season. Old Captain Jones and his wife were good enough in their way. Jerry Jones thought there were few boys like the 'Doc', and would have been very much grieved to lose him. Mrs Jones, too, was rather fond of Ransom, and waited upon his every want—when she knew just what he wanted. But their care and attention were, after all, of a very rough-and-ready character. The old lady regularly administered the medicine left by the doctor, and three times a day tendered the sick man such homely food as formed their own meals. But there was something lacking, a something that could only be supplied by tender, delicate, and loving hands, a something which even Charlie—who had known nothing of a home since he was eleven years old—sally missed, and the more so as he passed the crisis of the fever and convalescence set in. For, although Ransom was very ill indeed, he did get better, and everybody in Pan Handle City was glad of it. All through the days of prostration and delirium inquiries from his friends had been frequent, and not a few of them had called daily at Jerry Jones's house for bulletins from Charlie's doctor and nurse. Among these was Murie Reese, who missed her favourite pupil more than a little. The first day that Ransom was pronounced out of danger, and while he was very, very weak, Miss Reese begged to be admitted for a moment to the sick-room.

When the school teacher stood in the tiny bed-chamber she was very much shocked and grieved. The whitewashed walls were quite bare, and there was no carpet, or even a mat, upon the floor. All that the room contained was a rough table, one chair decidedly the worse for wear, Ransom's large trunk, and the narrow cot-bed upon which lay the listless form of the Doll—so changed, that had she not been certain it was he, Marie Reese could hardly have recognised him. The curly hair was dank and tangled, the full ruddy cheeks had become pale and thin, while the bright eyes were sunken and covered by heavily drooping eyelids. Outside the coverlet rested two bony hands, one of which the school-mistress took in her own, that were so plump and warm. But Ransom never moved, and gave no sign that he was conscious of his visitor's presence. Marie thought that he slept; and as a tear of pity started from her eyes, she bent over the sick lad while her lips pressed upon his cheek a sisterly kiss of sympathy and compassion. It was a pure and innocent caress—a caress prompted by the peculiarly forlorn condition of poor Ransom in his unlovely room. She did not pretend to give any deeper meaning to the kiss, because she felt nothing deeper than friendship for the lad, and would not upon any consideration have had him think so. Her attachment for the Doll was the warm friendship, perhaps patronising friendship, of an elder sister for a younger brother. Marie Reese meant all that she felt; but she meant not one whit more than she felt, for Charlie Ransom. And she knew nothing of the delicious thrill which that simple kiss sent through the pulses of the weary and worn invalid; she knew nought of the effect which it produced upon the poor fellow, who slowly opened his eyes and watched her, with a curious smile of satisfaction upon his face, as she quietly lifted from his room to Mrs Jones's kitchen.

How should she know that her token of kindly sympathy had seemed to the lonely lad, whose heart ached and yearned for more than sympathy, a direct answer to the question which had racked his mind all through the winter? And why should Charlie Ransom—the homeless untrained lad, whose life had been spent amid scenes where education and refinement were chiefly conspicuous by their absence—why should this unsophisticated deck-hand of a little river steamer be different from other men? Why should he be better able coolly to calculate and calmly to judge where men with greater advantages act entirely without judgment and calculation?

Certainly, Marie Reese was at least three years older than the Doll, while the intellectual and social gulf which yawned between them was so wide and deep that a generation of years could not bridge it. But when love's fervid heat sets young blood a-boiling, such discrepancies and inconsistencies become questions scarcely worthy of consideration—nay, they vanish altogether. It was so with Charlie Ransom.

The next day, Marie Reese was again a visitor to the sick lad's room, and this time she did not go empty-handed. Dftly she fastened to the window a muslin curtain which she had begged of Mrs Lamson, and 'without sound of hammer' hung upon the poverty-stricken walls a couple of little steel engravings of which she had robbed

her own room. Upon the table she set a tiny glass vase, in which she placed a bright crocus, the only flower that she could find in the window-boxes of Captain Peter's parlour. But these slight additions made a wonderful change for the better in the 'eight-by-ten' bedroom, and greatly aided the Doll toward a rapid recovery. Then, with kindly skilful hands, that were so different from Mrs Jones's, the schoolmarm arranged Ransom's pillows, talking to him cheerily the while.

'Now, Ransom,' she said, as she prepared to go, 'is there anything I can do for you—anything?'

'Yes, Miss Reese; there is something I should like. I should like you to give me, or lend me if you can't spare it, your picture. Will you, marm—and set it right by the table yonder?'

'I will see what I can do for you,' said Marie. 'Is that all?'

'No, miss; there is something else. I have never heard you sing; but I somehow fancy that you can if you try. Will you sing me something the next time you come? I like music—had a notion once to learn it myself, and there's a bit of a banjo in my trunk.'

'Well, well! You have Mrs Jones get the banjo out, and I will see if I can manipulate it. Good-bye until to-morrow.'

To-morrow came; and after school, Marie went over to see her patient, as she now called the Doll. She entered the room very noiselessly; but Ransom was wide awake, and eagerly watched her as she deposited upon the table a small Oxford frame containing a portrait of herself. By the side of the trunk lay a cheap banjo, which Marie took up, picking over the strings with the fingers of an expert. She played the instrument as easily and as naturally as a New Orleans darkey, and charmed her listener with a long repertoire of songs that included *Annie Laurie* and *The Swanee River*. She was about to lay down the banjo, when Ransom brought forth from under his pillow a small sheet of music and some printed verses. It was a hymn-tune arranged for the banjo, and the words were those of an old-fashioned Methodist revival hymn. To Marie it seemed a curious enough melody for a banjo; but Ransom begged her to play it.

'It's the only tune as I ever learned to sing, Miss Reese, and it's the only tune I ever tried to play, though I never quite managed that. I kinder like it, 'cause they sung it the only time mother ever took me to church in the old days at Pittsburg.'

When Marie read over the accompaniment as printed, there seemed to her very little music in the tune; but she rendered it in a setting of her own, and sang in her sweet soprano voice:

My heav'nly home is bright and fair;
Nor pain nor death can enter there;
Its glittering towers the sun outshine;
That heav'nly mansion shall be mine.

She went through all the verses; and to Charlie Ransom the singing of that simple old hymn seemed the most divine music he had ever heard. Always after that, when Marie Reese called to see him—which she did every day until he was well enough to get about a little—he coaxed her to sing for him the 'heavenly mansion piece.'

But if those days of convalescence were as a sweet and happy dream to Charlie, he experienced a very rough and sudden awakening upon the very first day that he was able to leave the house.

During the last week of March, Pan Handle City began to awaken from its state of winter lethargy. The ice was slowly disappearing from the Tombhicken Creek, and the first downpour of rain would create a flood, more or less severe, that would soon wash the last vestige of ice and snow from the lowlands of the Valley. Even now, Captain Jerry Jones was busy each day, oiling, greasing, tarring, and washing each nook, corner, and working part of the *Petroleum Gem*, in anticipation of a rushing spring business. All the owners of wells were getting ready innumerable barrels of oil for shipment down the river; and those who had failed to secure legitimate vessels for transporting their output were engaged in constructing rafts of sundry designs and dimensions. Even the women were busy, preparing for that annual phenomenon known as 'spring cleaning,' which not even the primitive homes of Pan Handle City could escape. Down at the school Marie Reese had her hands full; for before the end of April the school-year would close, and while the schoolmistress did not purpose to return to the settlement in the autumn, she wanted to complete all the work she had mapped out for herself when she undertook the task which she had, thus far, so faithfully performed.

With these many signs of activity about him, Charlie Ransom felt like a drone in a hive as he strolled out in the feeble sunshine of a March afternoon. Partly from inclination and partly from force of habit, Ransom wended his steps toward the schoolhouse, where his arrival was not the only surprise to which the scholars were to be treated that day. The schoolmistress insisted upon the Doll occupying her chair, which was the only comfortable seat in the room. Of course Ransom disliked to deprive the teacher of her seat, and made some protest; but he yielded at last. As he sat by the side of the little desk, he felt more than pleased at so signal and public a mark of personal kindness from the woman for whom he would have cheerfully drained each drop of his life's blood.

It was well-nigh time for the dismissal of the scholars, when a horse was stopped at the door of the schoolhouse, where its rider dismounted. A moment later, a fine handsome man of thirty-five in coat and riding-breeches strode up the little aisle of the schoolroom. He displayed not the slightest sign of bashfulness in his manly bearded face, and he walked with a quick firm step, which seemed to indicate that his only immediate object was to reach as speedily as possible the pretty blushing woman whose hand rested upon the unpretentious desk, with sensations which were not—and never could have been—understood by the amazed pupils, both big and little. Totally oblivious to the half-hundred spectators, the stranger grasped both the schoolmarm's hands in his own, and actually bent his head down until he almost touched the beautiful face with his mustache. Indeed, it was afterwards distinctly alleged by all who witnessed the performance that the gentleman undoubtedly intended to kiss Miss

Reese, and would have done so had she not prevented him.

'Why, John Burlington, I am ashamed of you, sir! Have you no respect for the dignity of my position in this place? Can you not wait half an hour?'

'Well,' said the handsome stranger as he slowly drew back and released one of the little hands—'well, yes; I can wait as much as half an hour, but not a minute longer. Having discovered you in your hiding-place, I assure you that I intend to demand a speedy reward.—Introduce me to your scholars, Marie.'

To Marie Reese the appearance of Mr Burlington was as much a surprise as it was to the scholars, and as she felt quite unable instantly to collect her scattered thoughts and plans, she was glad of the respite which a compliance with the gentleman's request afforded. So she tapped upon her little bell and, rather confusedly for her, said: 'This is my friend, Mr John Burlington of Philadelphia. I believe he has a few words to say to you.'

'Yes,' said Mr Burlington, closely following the teacher's words; 'and as you—no doubt all of you—consider Miss Reese your friend, you must count me in on the same footing. Because, you see, Miss Reese is, my very best friend, and—I don't know whether I am telling an old story?—I have come down here expressly to hurry her away from you, as she has promised before long to become Mrs Burlington. Now, I am greatly interested in this school; and if your teacher will let me, I am going to give a few prizes. See! Here are two twenty-dollar gold-pieces and two ten-dollar gold-pieces. I shall give these to Miss Reese, and she must award them as prizes.—Now I shall take upon myself to dismiss the school for to-day.'

The fifty up-turned faces brightened with happy smiles or expanded with broad grins as John Burlington clinked the large gold coins, and there was a loud buzz of chuckling and chattering as the pupils slowly dispersed.

But there was one face in that room which had not brightened much during the few minutes that had elapsed since John Burlington's sudden entrance. In the teacher's chair sat Ransom, all his golden hopes shattered and dispelled by the public assertion of the stranger—a bold and unmistakable statement which had passed uncontradicted by Marie Reese. Yes, the fool's paradise into which Charlie had so lately wandered had now become transformed into a dismal swamp of cruel and bitter disappointment. He gazed and listened like one in a trance or, rather, a dreadful nightmare. He wanted to leave the horrible place that seemed so close and stifling, and yet, when the opportunity came for him to go with the rest of the scholars, Ransom remained in his seat. He never knew why he did so, but at the last he was still there, while close beside him stood the woman whom he madly and insanely loved—her hand clasped in that of the man of her choice.

But, as Marie had never dreamed of the Doll's unspoken hopes and anticipations, and had been utterly unconscious of the effects of her compassionate kiss, so she was now quite ignorant of the misery which had taken up its abode in the mind and heart of Charlie Ransom.

'John,' said Marie, who had recovered somewhat from her surprise, 'this is Ransom, whom I have mentioned so frequently in my letters. You know he has been very ill, yet I think he will secure one of your prizes—one of the large prizes, too.' Then, turning to the Doll, she added: 'Ransom, Mr Burlington has introduced himself so well that there is nothing left for me to say.'

Very warmly, honest and happy John Burlington grasped the young fellow by his thin hand. 'Mr Ransom,' he said, 'you don't look very strong: I fear you have had a hard siege of sickness; but I hope you will soon pick up. I have to thank you, I am sure, for looking so well after Miss Reese. I have heard all about your kindness shown to her in many ways. You will have to come down to Philadelphia next winter and pay us a visit; but as I am soon going to rob all you Pan Handle City folks of Miss Reese, I should like to give you, right here, a little bit of a keepsake from both of us.' Mr Burlington unfastened from his waistcoat an elegant gold watch—his own—which he handed to Ransom. 'No; take it,' he said, as Ransom hesitated; 'don't imagine you are robbing me at all.'

'Yes, take it, by all means,' added Marie, who knew that Burlington would feel hurt if the gift should be refused. 'You know, you wouldn't have liked me to say "No" when you were so good as to give me the skates.'

So Ransom took the watch and mechanically thanked the giver. But as he walked away, his heart became hardened with disappointment and wounded pride and jealousy and all the wretched feelings that follow in their train. He hated the man who had secured the love of Marie Reese, and he would have liked to hurl back his gift. He longed to smash the watch into a hundred pieces; but he carried it to his room and put it clear down in the bottom of his trunk, where he vowed it should lie buried until the schoolmarm's departure from Pan Handle City, when he would drop it into one of the deep pools of the Tomhicken Creek.

Well, Charlie Ransom was only a lad, and the few years which he had lived had been passed in a corner of this world where human nature is very human. As he reviewed the events of the winter, and then thought upon his present wretched position, he failed to understand why disappointment should be for him and happiness for John Burlington. Charlie Ransom was no philosopher.

The reader will have understood ere this that the main portion of Pan Handle City was on the north side of the Tomhicken Creek, across which there was no bridge of any kind. But along the south bank there were three or four wells, none of which were very profitable either on account of the quantity or quality of the oil extracted from them. Captain Peter Lanson owned one of these unproductive wells on the south side of the creek, and as soon as spring opened he resolved to have it 'shot.' 'Shooting' a well is a process peculiar to the Oil Country. There are in the oil regions several distinct strata of 'oil-sand' and between these strata of sand there are layers of rocks. These sands are saturated

with petroleum, and are *pressed* by the layers of limestone rock, which the oil cannot penetrate. When the oil-well drill passes through the first limestone stratum, the immense weight of the rock upon the oil-sands causes the petroleum to rush upwards through the hole or well made by the drill. When a well is drilled into the first layer of sand, it is only a question of time—sometimes days and sometimes years—when the oil in that vicinity 'gives out,' and the quantity which can be pumped perceptibly diminishes. But a torpedo of nitro-glycerine or dynamite 'shot' to the bottom of the well and there exploded will generally shatter the next layer of limestone, and so cause a fresh flow of oil from a lower stratum of sand. There are men—reckless fellows, usually, who carry their lives in their hands—who make a business of 'shooting' wells. It may be readily imagined what a frightful risk the 'shooter' runs in filling the nitro-glycerine shells and lowering them into the wells. Upon the upper end of the last shell is fastened an ordinary gun cap; and then an iron cylinder weighing about six pounds is 'shot' at a fearful rate down the well—often fifteen hundred feet deep—and the deed is done. The noise of the explosion is seldom heard; but the success or failure of the 'shot' is soon determined, for a successful shooting results in a terrific flow of oil, which for the first few minutes scatters about the debris of the explosion, consisting of shattered cartridge shells and pieces of rock and sand.

Two or three days after John Burlington's advent to Pan Handle City, when he had taken up his quarters for an indefinite period in Tommy Van Horn's house, Captain Peter's well on the south side was 'shot' with wonderful success, and the oil flowed out in a huge stream to a height of twenty-five feet. The 'shooting-fiend'—as the operator of the torpedoes was generally termed—had come over specially from Bradford in his light wagon, purposely constructed for the transportation of himself and his dangerous materials and tools. No one accompanied him; but the Captain and the oilmen were on the south side, where they stood at a respectful distance from the well until the 'shot' had been fired. Then the 'fiend' returned to his wagon, leaving the revived well to the care of its owner and friends.

Now, it so happened that a few minutes after the torpedo operator had landed and driven off in his wagon, two men sauntered down to the river-side. One of these was John Burlington, and the other was the Doll. Both had intended visiting the scene of the excitement across the creek; but when Ransom guessed the other's intention, he drew back, as he had no desire to be the companion of a man whom he hated.

This was Burlington's first visit to the oil regions. Everything about him was strange; and with true American instinct he endeavoured to learn all that could be learned and to see all that could be seen. There had been a severe drain upon the small floating craft that morning, and the boat which the torpedo-man had just vacated was the only one then available on the north side of the creek. As the boats were to a certain extent common property, Burlington entered this one. As he seated himself and adjusted the oars in the rowlocks, he noticed a very ordinary-

looking tin can, painted red, but he gave it no second thought. It did not belong to him, and as it was not in his way, it might remain in the bottom of the boat.

Ransom, who was standing perhaps twenty yards away, also saw the red can; but, unlike Burlington, he knew full well that it contained some of the deadly nitro-glycerine—knew that it was a can which the 'shooting-fiend' had, in his hurry to get away, forgotten. He knew, too, that the creek was full of huge masses of ice which the spring thaw had loosened. Ransom was perfectly aware of all the dangers which Burlington hazarded in crossing the swollen creek, and was quite conscious of the awful possibility of a collision, in which case the boat and its occupant must meet with total annihilation. All this Ransom knew, yet uttered never a word of caution. What was it to him? He did not place the can in the boat; the dynamite was not his, nor the boat either, neither was he responsible for John Burlington's safety. Why should he seek to prevent an accident to the man who had robbed him of his peace of mind, of his pleasant airy castle, of that which had been paradise to him, even though but a fool's paradise? On the other hand, why should he not let this handsome and refined City man—this peculiarly favoured son of fortune—go right on into the very jaws of death? If Burlington were dying, drowning beneath his eyes at that moment, it is doubtful if the Doll would have stretched forth a hand to save him. Why should he? Why should he? Over and over in the course of twenty seconds Ransom asked himself these and similar questions, and all the time Burlington was slowly rowing out into the dangers of the swollen stream. No; he would not interfere. If Burlington should die, so much the better: wildly he thought that such a catastrophe might give him one more chance to win the love of Marie Reese; and if he failed, she certainly would not then be for John Burlington.

Suddenly there was a peculiar noise and a strong concussion, which severely shook Ransom. He knew what it was, for he saw before him the foam upon the seething, bubbling water, where an instant before the little boat had been. But the boat and the man who was rowing it had disappeared.

A BIDDING WEDDING.

AN OLD WELSH CUSTOM.

THERE are few districts in the United Kingdom in which there are not some customs peculiar to the locality, many of which have come down from 'fable-shaded eras,' some of them betokening by their rudeness and simplicity that they have altered little since the 'merrie days of old,' when men carried out in their sports and pastimes something of the warlike spirit of the age. Some of these customs are traced by tradition to a more or less authentic origin, while others go so far into the misty regions of the past that no legend remains to tell us of their source. It must be allowed that some of these practices were rude and objectionable; but some, again, are so attractive in their quaintness and sim-

licity, bringing up reminiscences of all that was most admirable in primitive times, that it is with something like regret that we see them falling into disuse in this era of social progress. In no part of Great Britain have greater changes taken place during the reign of Queen Victoria than in Wales, the great development of mineral wealth having caused large towns to spring up where formerly a few scattered farmhouses and shepherd's huts dotted the green mountain sides. There are still, however, many sequestered valleys where the sound of the steam-engine has never been heard; where the rustic natives hold the even tenor of their way much as their fathers did of yore, careless of the noise and bustle of the world that lies beyond their native vale.

In certain parts of Pembroke and Carmarthen, one of the quaintest of marriage customs used to be prevalent, and it is said still to linger to a certain extent in some of the more remote valleys, but now curtailed and shorn of its pristine surroundings. This was known as a 'Bidding Wedding,' and was so redolent of patriarchal times, that it may be interesting to describe what is destined soon to become a mere memory of the past. Tradition is silent as to the origin of this custom of Cambria, so we may presume that it goes a long way back indeed. The conditions necessary to carry it out could only be possible in a district where the inhabitants were rooted to the soil, where the farms and holdings descended in unbroken succession from father to son; and where no interlopers were allowed to usurp the rights of the native population. To illustrate this, we will endeavour to describe a Bidding Wedding as carried out forty years ago, when the institution was maintained with all its original characteristics. The details were given us by an intelligent native of the district where it prevailed, so that they may be relied on as correct in every respect.

In the first place, all who received invitations were expected to show their respect to the bride and bridegroom by bestowing such presents as befitted their station and means. We may remark that these weddings were generally restricted to the farmers and others of the more respectable class, so that to have a Bidding implied a certain social status, and that the young couple were both come of respectable families.

When two of this class made up their minds to get married, the first thing considered was who were to be invited to the festivities, a list being made out, varying according to the number of their friends and neighbours, from forty or fifty to upwards of two hundred. Invitations were written or printed, and sent round to all those whose presence was desired. After these had been despatched, the next thing was to send round the 'Bidder,' there being one person who filled this important post in every district. The duty of this worthy was to go to all places where invitations had preceded him, there to advocate the claims of his clients to the best of his ability. The Bidder, as may be supposed, was generally a noted character, the local wit and orator, as no one could hope to fill the responsible position who had not 'the gift of the gab.' In some instances females held office, for which they were doubtless as well qualified as their male rivals. These functionaries were generally cordially received,

and were in the habit of specifying any particular articles that they thought desirable, generally fixing their requests high, on the principle that they who asked for a sheep were likely to get a lamb at least. On completing the round of calls, the Bidder gave in his report to his employers. The presents were sent before the wedding to the house of the bride, when a large company assembled to view them and discuss their value. From the fact that intended presents were all entered on the Bidder's book, there were seldom too many articles of one sort; a business-like proceeding which the fashionable world of to-day might copy, as an advance list might save them from having so many 'repeats' in their marriage presents. The articles sent on those occasions were of the most varied description: a cow or a fat pig from some of the more wealthy; sheep and fowls; articles of furniture; bedding and crockery; so that the young folks had little occasion for expenditure in furnishing their house.

In addition to the presents, there was another source which went to enrich the young couple, and served to give them a good start in matrimonial life. This was known as the *pryths*, or payments, which consisted of a certain amount of money previously received by the payer on his or her marriage from relations of the bride or bridegroom. These payments were looked upon as debts of honour to be repaid when called upon; and when any were due, they were sometimes reminded of them in the letter of invitation. On the night of the wedding these amounts were received, when some one was appointed as clerk to make a list of all the payments. This list was carefully preserved, that the married pair might know to whom they were indebted, so that they might repay the amount when called on in turn on a similar occasion.

The procession to church was highly striking and picturesque in character; and even in the marriage ceremony there were peculiar forms suggestive and original. One in particular was always watched by the company with great interest, as it was in some measure indicative of the social status of the bridegroom. When the clergyman was engaged reading the marriage service, the bridegroom took from his pocket a sum of money and deposited it along with the wedding-ring on the Prayer-book. From this sum the clergyman deducted his own fee and the clerk's, and then handed over the remainder to the bride. It is said that one clergyman, probably an Englishman, pocketed the whole amount, till the clerk told him what the custom was, when he was forced to 'fork out' again and tender an apology to the fair bride.

After the marriage ceremony, the party wended their way back to the residence of the bride's parents. As most of the company were generally on horseback, a race ensued, somewhat in Eastern fashion, in which some of the party were almost sure to come to grief; but such disasters were never suffered to interfere with the hilarity of the company. A tradition of a tragedy in connection with this custom tells how the bride, reputed the fairest maid in all the district, was killed by being thrown from her horse on the way back from church. It is said that the event is recorded in a country churchyard in Garmarthen-shire, the stone bearing the date of 1766.

In this and some of the adjoining districts of Pembrokehire the Welsh language is almost unknown, the inhabitants consisting mostly of the descendants of a colony of Flemings who settled here early in the sixteenth century. The Bidding, however, seems to be of native Welsh origin; and it is said that very similar customs prevail in Brittany, where the inhabitants both in manners and language bear a much closer resemblance to the Welsh than any of the other branches of the Celtic race in the British Islands.

On returning from church, dinner was placed on the table, after which the 'best-man,' who was there termed the 'tailor,' took the management of affairs, and exerted himself to bring in money from the guests, to swell the fund for the benefit of the wedded pair. For this end beer was provided, which he retailed to the company in defiance of the excise. Large quantities of buns or wedding-cakes were also vended, the young men treating their sweethearts liberally with these. When trade seemed to be falling off, the 'tailor' would propose having a 'scot,' which consisted in himself putting down a shilling on the table, when most of the men would follow his example, some of the more liberal going as high as half-a-crown. These 'scots' would be repeated several times in the course of the night, in proportion as the mirth and glee grew fast and furious, so that what with these and the *pryths* and presents, there was generally a good sum raised, if the young couple were at all popular with their neighbours. It is said that upwards of one hundred pounds has been known to be raised on one of these occasions, certainly a good help for a young farmer or tradesman to begin married life with.

Such was a Bidding Wedding as it was carried out in some of the romantic valleys of ancient Cambria in the days of lang syne. Though they may still be occasionally met with, they are now shorn of most of their ancient glory, and destined soon to become a memory of the past. The changed conditions of modern life render them impracticable, and the fact that they have been so long kept up is an illustration of the tenacity with which the Welsh people cling to old customs. These Biddings were certainly calculated to keep up a feeling of sympathy and true neighbourliness, and to engender peace and good-will in the district where they flourished.

WITTY FOLKS: A DULL MAN'S PROTEST.

I AM a dull man, naturally slow and dense in my mental grain, my friends tell me, yet not without my uses in the world; one of which, I sometimes suspect, is that of serving as a butt for the witty sallies of the more brilliant members of our small community. Ours is a quiet little town, embosomed in wooded hills, which rise with gentle swell from out a wide expanse of rich undulating well-cultivated country. A simple, homely, monotonous place it is, with few except commonplace interests, with no special charm to boast of, except what lavish Nature drops from her full hand as the seasons pass over us. Elich May-tide she touches with subtle beauty the blushing blossoms of the apple-trees, and wreathes

the helgerows with fragrant hawthorn. She brightens with vivid emerald the woods and fields; and paints with tints of varied loveliness even the little patches of lichen that cling to the time-worn walls of our antiquated comfortable dwellings. These dwellings offend against every rule of architectural taste, and yet serve their purpose as well as if the best architect in the world had designed them. Even in winter they look cheerful and inviting, fenced in as they are from the cold winds with tall clumps of evergreen, laurels and hollies, and here and there a closely clipped hedge of yew, beneath whose sheltering screen a sunny border spreads. There the first-born flowers of the year, the early snowdrops, peep through the frost-bound earth like rows of pearls, and crocuses unfold their golden cups in the feeble sunshine, and fragrant violets scent the rough March gales. There, in summer, bloom sweet old-fashioned roses and clove carnations, filling the air with delicious old-world scents; and in autumn, tall dahlias wave over vivid patches of scarlet geranium and gay calceolarias.

Naturally, our wit partakes of the bonhomie of our simple unsophisticated life; it has a ring of Sleepy Hollow about it; it is racy of our green hill slopes, of our showers of apple-blossom, of the resinous breath of our fragrant pine-woods. I doubt much if even Major Mamul, whose special victim I am, could have the heart to say to me what Voltaire once said, when introducing to a large company a certain individual of no great parts whose name was Adam: 'Monsieur Adam, gentlemen; but by no means the first of men.'

No; even the Major, free-lance as he is, is seldom out and out ill-natured, unless when a fit of gout is impending. Then he once said to me, at Mrs Couppelle's too, to make the matter worse: 'My dear Slocum, I never saw you looking better, or any other man looking worse.'

Every morning, as I saunter along slowly under the tall lime-trees which shade the road leading to the station, which is the favourite promenade of our notabilities, I meet the Major. A man he is of grand bearing, tall, erect, with a thin proud saturnine face, a large aquiline nose, and a grizzled moustache. Of a morning he is always to be seen tightly buttoned up in a long surtout, with an old-fashioned black stock round his neck, which gives him a peculiarly stiff uncompromising look. As he marches along, I can see by the puckering of the crow's-feet at the corners of his eyes and the twitching of his thin lips that he is meditating some half-dozen jests all more or less bitter. 'How are you, Slocum?' he cries out, in such a frank, genial, open-hearted way, that, well as I know him, it almost puts me off my guard, and I have desperate thoughts of throwing myself on his mercy, knowing as I do that I am to meet him to-night at the house of a mutual friend, and that two other witty members of our small world are also to be there. I know full well what I must go through, before, buffeted and bewildered by the nimble strife of tongues around, I shall have leave to subside at last with a couple of comfortable dowers, and a battered old foggy like myself, into the safe but by no means always serene refuge of the 'whist-table'; for I am—well, I don't mind admitting, that as a whist-player many may be better than I am, but few can be worse.

A few steps farther on, where the passing sun-beam glistens on the ivy-covered gable of that handsome Elizabethan house, our lawyer steps briskly out into the street, a prosperous, pushing, self-satisfied man, who so much affects the society of wits that among us he passes for one; although, as the Major sometimes says savagely, 'He is not only dull himself, but is a cause of dullness in others.' His wit is second-hand; it has a legal and forensic cast; and as I seldom come to grief by it, I have an amazing relish for his old oftentold stories. If Mr Monypneas has a weakness, it is for great folks; and he often introduces us of an evening to very fine company indeed. His good things are the smart sayings of Lord Chancellors, Judges, Attorney-generals, and such-like.

As I saunter indolently on under the spreading lime-trees I wonder what he will give us to-night. Will he tell us of the Welsh judge who was famous alike for his neglect of personal cleanliness and his insatiable desire for place, and who once upon a time was addressed by a friend in the following flattering terms: 'My dear sir, as you have asked the Prime Minister for everything else, why have you never asked him for a piece of soap and a nail-brush?' Or how Lord Ellenborough during a severe winter was so annoyed by the continuous coughing in court, that after a good deal of fidgeting about in his seat, he availed himself of the first lull in the bronchial storm to say severely: 'Some slight interruption one might tolerate; but there seems to be an industry of coughing here.' Or when a young barrister, making his first appearance in Westminster Hall, began: 'My lord, the unfortunate client for whom I appear' (hesitation and long pause)—'My lord, I say the unfortunate client'—another prolonged pause, broken by his lordship observing in an encouraging tone: 'Go on, sir—go on; so far the Court is with you.'

Mr Monypneas bubbles over, indeed, with Lord Ellenborough, and has a whole treasury of his smart sayings. Preston, a great conveyancer, was a very uninteresting speaker, and having inflicted upon the Court a speech of portentous length and inconceivable dreariness, he asked when it would be their lordships' pleasure to hear the remainder of his argument. Lord Ellenborough, with a sigh of resignation, answered: 'We are bound to hear you; but as for pleasure, that has long been out of the question.'

The same learned judge, when he heard that Lord Kenyon, whose miserly proclivities were well known, was about to leave a world in which his chief enjoyment had been the acquisition of money, exclaimed in a tone of surprise: 'Kenyon die! Why should he die? What will he get by that?'

Lord Camden comes next, and we hear how, being on a visit to his friend Lord Dacre, they while out walking passed the parish stocks. 'I wonder if the punishment is physically painful?' quoth Lord Camden. 'You had better try it,' said his friend. Whereupon the Lord Chief-justice sat down, put his feet in the holes, and observed complacently: 'Now, Dacre, fasten the bolts and leave me for ten minutes.' Lord Dacre at once complied, and sauntered off; but being a very absent man, he forgot to return, and Lord Camden was left in the stocks for ten minutes

but for ten hours. He became faint and giddy; he was devoured by a raging thirst; as the long day went on, the pains in his cramped, confined limbs grew agonising. In vain he besought mercy from the passers-by; and informed them that he was no common convicted culprit, but Lord Camden, the Chief-justice of England. They laughed in his face. 'You are mad with liquor,' said one clerical Levite who passed by on the other side. 'I hope thy punishment will prove for the good of thy soul,' said one good Samaritan, a farmer's wife, and to that end, and that he might not die of thirst, she presented him with a juicy apple. He was more dead than alive when he was at last released and carried to Lord Daere's house.

Then we hear with much interest, for we are a prudent and frugal race, of the thrift of Lord Chancellors and their ladies. Lord Hardwicke was so famous for his overweening frugality that it won for him the sobriquet of 'Judge Gripus.' His lady had the same tastes as himself, and refused to allow her husband to accept an earldom until his daughters were married; for, said she, 'although ten thousand pounds may be thought a very fair fortune for Miss Yorke and her sister, not less than twenty thousand will be expected with Lady Margaret and Lady Betty.'

Our third wit is Mrs Coupelle, a handsome, buxom, Juno-like dame, who is—as even the other ladies, who detest her, are compelled to own—a very fine woman indeed—fine in person, fine in dress, fine in all her surroundings; for she is a well-dowered widow, and is in the matter of expenditure a law unto herself. She does not affect simplicity or go in for economies of any kind. Rich sumptuous surroundings become her, and she knows it; so do somewhat theatrical attitudes, and she uses them. I know exactly how I shall find her to-night, superb in black velvet and diamonds, with her beautiful fair hair gathered into a mass of light fluffy curls above her brow, the whole coiffure finished artfully off with a plait which has the appearance of a coronet. Her large lustrous eyes, as innocent-looking as the blue forget-me-nots in the meadow, will meet mine with a soft pensive expression, which I have learned too well to interpret. A rustic romance, you say, an idyll of country life full of chivalry and tenderness—the old, old story, with poor foolish Tom Slocum for hero. Bah! the lady has not one vulnerable spot about her; she is armed at all points. There is no joint in her harness of mail. Even Major Macnab is afraid of her, and has never once ventured so much as to attempt to take her off.

Is she clever? I do not know. She is quick of eye and ear, and talks sometimes as if she were indolently conscious that life has high ideals, and even common-place duties; but, unfortunately, all things in the world seem to turn towards her their ridiculous side. When she speaks gravely, as she sometimes does, a jocking banter seems to lurk in her tones, and she is, according to her varying moods, by turns unfeelingly mischievous, and passably good-natured; one moment full of the most delightful oddity and fun, the next uttering a sarcasm so bitter that even the Major is appalled; his scalping-knife is never so utterly pitiless even in his worst fits of gout. Shrewd she is, and penetrating, yet easy and pleasure-loving without, shy of friendship, careless of love, yet

strangely charming, brightening everything she touches with her flashing gleams of wit, as the sunbeam gilds for a moment the brown furrows in the muddy fields.

I have been just to her; for I am impartial, as slow men often are; and yet, of all my tyrants, she is the worst. I know that she laughs at me outrageously and unmercifully, even to my face; and yet I can in no way help myself. I cannot even avoid her. In her presence, a curious spell, which I am powerless to resist, is upon me. From the farthest corner of the room, a single glance of those bright laughter-loving eyes is sufficient to sweep me to her side, a helpless, unresisting victim. She greets me with a smug smile, and holds out a soft warm hand, and my martyrdom begins, and I wriggle and writhe in my shame-faced anguish till the whist-table is set agoing, when I subside with a stifled sigh of thankfulness into a chair opposite Lady Rorison, a dear stout motherly woman, who knows that, after a dose of Mrs Coupelle, the patient requires rest. As the widow of a distinguished officer who was knighted for his services to his country, her ladyship of course fares better at Mrs Coupelle's hands than I do, who am only plain Thomas Slocum, of no place, and nothing in particular; still, there is that in her ladyship's configuration, mental and physical, so provocative of the lively widow's mirth, that she could never quite escape her Parthian arrows, even were she Queen of Sheba. As it is, she also has suffered; and she glances at me over her spectacles with a compassionate fellow-feeling, and is patient with my mistakes.

I wonder, in my slow way, between the pauses of the game, what sort of time of it the late Mr Coupelle had with his superb partner. I never saw him; he had died before my aunt left me the comfortable house and comfortable income which procured for me admission into the somewhat exclusive circle of which Mrs Coupelle is the bright peculiar star; but I have heard of people being tickled to death. Is it possible, I wonder, for people to be laughed to death—to have all strength and spirit crushed out of them by the unceasing flow and sparkle of their companion's wit?—much as the sun drinks up the dew, which is like lifeblood to the thirsty earth.

The wind rustles as I walk through the sere leafless branches of the limes. I watch the wan winter sunshine as it flickers over our peaceful churchyard and warns into quiet beauty the lovely grayish-green lichens that cluster over the old stones of its wall. For him who was once Mrs Coupelle's husband, the supreme tragedy of life is over, the problem of existence is solved. We speculate and doubt; he knows. No curtly care or disquietude has power to ruffle his ineffable calm; yet I cannot help wondering, as I walk, with that lack of all attention to logical sequences which is natural to me, if it does not seem hard to him that he should be lying there in that wintry corner, with the chill radiance of the December sunlight coldly gilding the splintered peaks of his costly granite monument, while she sits warm and bright in the glow of the firelight, and her gay laugh rings out clear above the nimble encounter of wits, and her quick thoughts find for themselves winged words of fire that fascinate even while they sting. Life has no sad burden for her; she dwells amid its flowers; her days are as

bright now as ever they could have been in the golden light of the years that are gone. It is all as it should be, no doubt, and yet the contrast strikes me with an odd sort of vicarious indignation. I am gradually, in my slow way, warming up to be angry, when there she is before me as if she had dropped from the wintry clouds. Sure no blush of spring was ever so sweet as the exquisite peach-like glow that mantles in her cheeks; her hair glitters in the sunshine with a sheen as of gold; her red lips curve with a smile of joyous welcome; she holds out a kind hand to me, and I am happy. Life has its exquisite moments even for me. To-night, no doubt, I shall repent and do penance for my folly. I am a fool, I admit it; but then folly can be so sweet—so much sweeter, sometimes, than wisdom.

CONCERNING THE GOOSE.

THE goose figures largely in the history, the legends, and the proverbial lore of our own and other lands. In ancient Egypt it was an object of adoration in the temple and an article of diet on the table. The Egyptians mainly took beef and goose flesh as their animal food, and it has been suggested that they expected to obtain physical power from the beef and mental vigour from the goose. To support this theory, it has been shown that other nations have eaten the flesh of wolves and drunk the blood of lions, hoping thereby to become fierce and courageous. Some other nations have refused to partake of the hare and the deer on account of the timidity of these animals, fearing lest by eating their flesh they should also partake of their characteristic fearfulness and timidity.

Pliny thought very highly of the goose, saying 'that one might almost be tempted to think these creatures have an appreciation of wisdom, for it is said that one of them was a constant companion of the peripatetic philosopher Lacydes, and would never leave him, either in public or when at the bath, by night or by day.'

The cackling of the goose saved Rome. According to a very old story, the guards of the city were asleep, and the enemy taking advantage of this, were making their way through a weak part of the fortifications, expecting to take the city by surprise. The wakeful geese hearing them, at once commenced cackling, and their noise awoke the Romans, who soon made short work of their foes. This circumstance greatly increased the gratitude of the Roman citizens for the goose.

We gather from the quaint words of an old chronicler a probable solution of the familiar phrase, 'To cook one's goose.' 'The kyng of Swedland'—so runs the ancient record—'coming to a towne of his enemies with very little company, his enemies, to slyghte his forces, did hang out a goose for him to shoote; but perceiving before nyghte that these fewe soldiers had invaded and sette their chiefe houlds on fire, they demanded of him what his intent was, to whom he replied, "To cook your goose."'

In the days when the bow and arrow were the chief weapons of warfare, it was customary for the sheriffs of the counties where geese were reared to gather sufficient quantities of feathers to wing the arrows of the English army. Some

of the old ballads contain references to winging the arrow with goose feathers. A familiar instance is the following:

'Bend all your bows,' said Robin Hood;
'And with the gray goose wing,
Such sport now show as you would do
In the presence of the king.'

To check the exportation of feathers, a heavy export duty was put upon them.

The goose frequently figures in English tenures. In a poem by Gascoigne, published in 1575, there is an allusion to rent-day gifts, which appear to have been general in the olden time:

And when the tenants come to pay their quarter's rent,
They bring some fowle at Midsummer, a dish of fish
in Lent,
At Christmasse a capon, and at Michaelmasse a goose.

A strange manorial custom was kept up at Hilton in the days of Charles II. An image of brass, known as Jack of Hilton, was kept there. 'In the mouth,' we are told, 'was a little hole just large enough to admit the head of a pin; water was poured in by a hole in the back, which was afterwards stopped up.' The figure was then set on the fire; and during the time it was blowing off steam, the lord of the manor of Essington was obliged to bring a goose to Hilton and drive it three times round the hall-fire. He next delivered the goose to the cook; and when dressed, he carried it to the table and received in return a dish of meat for his own mess.

In bygone times, Lincolnshire was a great place for breeding geese; and its extensive bogs, marshes, and swamps were well adapted for the purpose. The drainage and cultivation of the land have done away with the haunts suitable for the goose; but in a great measure Lincolnshire has lost its reputation for its geese. Frequently in the time when geese were largely bred, one farmer would have a thousand breeding-geese, and they would multiply some sevenfold every year, so that he would have under his care annually some eight thousand geese. He had to be careful that they did not wander from the particular district where he had a right to allow them to feed, for they were regarded as trespassers, and the owner could not get stray geese back unless he paid a fine of twopence for each offender.

Within the last fifty years it was a common occurrence to see on sale in the market-place at Nottingham at the Goose Fair from fifteen to twenty thousand geese, which had been brought from the fens of Lincolnshire. A street on the Lincolnshire side of the town is called Goosegate.

The origin of the custom of eating a goose at Michaelmas is lost in the shadows of the dim historic past. According to one legend, Saint Martin was tormented with a goose, which he killed and ate. He died after eating it; and ever since, Christians have, as a matter of duty, on the saint's day sacrificed the goose. We have seen from the preceding quotation from Gascoigne that the goose formed a popular Michaelmas dish from an early period.

It is a common saying, 'The older the goose the harder to pluck,' when old men are unwilling to

part with their money. The barbarous practice of plucking live geese for the sake of their quills gave rise to the saying. It was usual to pluck live geese about five times a year. Quills for pens were much in request before the introduction of steel pens. One London house, it is stated, sold annually six million quill pens. A professional pen-cutter could turn out about twelve hundred daily.

Considerable economy was exercised in the use of quill pens. Leo Allaticus, after writing forty years with one pen, lost it, and it is said he mourned for it as for a friend. William Hutton wrote the History of his family with one pen, which he wore down to the stump. He put it aside, accompanied by the following lines :

THIS PEN.

As a choice relic I'll keep there,
Who saved my ancestors and me.
For seven long weeks you daily wrought
Till into light our lives you brought,
And every falsehood you avoided
While by the hand of Hutton guided.

June 3, 1779.

In conclusion, it may be stated that Philemon Holland, the celebrated translator, wrote one of his books with a single pen, and recorded in rhyme the feat as follows :

With one sole pen I wrote this book,
Made of a gray goose quill;
A pen it was when I it took,
A pen I leave it still.

SHEEP-SHEARING BY MACHINERY.

THE ever-increasing substitution of machinery in place of hand-labour in all branches of industry is too often witnessed to need either comment or enforcement. Our readers, indeed—so accustomed are the public to novel adaptations of mechanical power—may hardly evince surprise in learning that the labours of the inventor have been successfully applied to furnishing means for shearing sheep by machinery, and that possibly ere long the well-known hand-shears used for this purpose will have given place to a patent shears actuated by steam-power, which will perform its work in a cheaper, speedier, and more effectual manner.

The sheep-shearing machine recently placed before the public is due to Mr Frederick York Wolseley, of Euroca Station, New South Wales—a brother of the distinguished soldier of that name—who has devoted many years of patient ingenuity to perfecting his invention. The machine itself may be briefly described as follows: A toothcomb upon which works a three-bladed knife, in the same manner as a patent horse-clipper, is pushed by the operator into the fleece of the animal to be sheared, the cutter being actuated by a cord of round gut, working inside a flexible tube six feet six inches in length. The flexible tube leaves the operator free to work the comb and cutters backwards and forwards.

Shafting of ordinary description is erected in the shearing-house, carrying wheels two feet in diameter and five feet apart, the motion being communicated from the main shafting to a series of leather bevel-wheels situated below, each of

which in its turn imparts a rotary movement to the gut core inside the flexible tube, and so to the small rods working the crank inside the casing of the machine. The pressure of the cutter on the comb is regulated by a tension-screw on the back of the shears. All the working parts are covered, with the exception of the comb and cutter.

Hand-labour, horse-power, water-power, or a steam-engine (portable, if desired) with a boiler to burn either wood or coal, can be employed to furnish motive-power to the main shafting, as the facilities of each locality or the number of sheep to be dealt with may demand.

One man, it may be added, can furnish power sufficient for three machines; a horse can drive from ten to twenty of them; whilst an eight horse-power steam-engine will actuate one hundred shears. The time occupied in shearing one sheep with the new patent is from three and a half to five minutes.

Many advantages are claimed for the novelty now under consideration. The work is performed more thoroughly than by hand, it being calculated that on an average some ten additional ounces of wool per merino sheep are obtained by its employment. The operation, moreover, is carried out more humanely, the cuts and stabs often inflicted in hand-shearing, more especially when executed as 'piece-work,' being entirely avoided, together with the consequent damage and deterioration to the pelts. It has been estimated that no less than one per cent. of the animals perish from injuries due principally to hand-shearing. The labour entailed on the operator is also considerably reduced; and aching hands, swollen wrists, and cuts or stabs to the worker himself, should be things of the past.

A series of exhaustive trials in Australia abundantly testify to the high esteem in which the new machine, the cost of which is very moderate, is held. When it is added in conclusion that Australia alone is computed to hold upwards of one hundred millions of sheep, it is evident how wide a field, if only in that one quarter of the globe, exists for the new sheep-shearing machine.

LIFE IN DEATH.

ALL life must fade. The scented damask rose;
The hawthorn buds that burgeon on the spray;
The dews that dry before the sun away—
All these, to man, a tale of Death disclose.
Yet life stands smiling o'er these transient woes:
'Tis true, he says, the crimson rose must fade;
Sweet hawthorn buds lie scattered on the plain;
The dews no longer pearl the grassy lawn;
Yet flowers of May spring forth to deck the shade,
Dewdrops dissolving full in summer rain,
Roses in odorous sweetness live again,
And silver starlight melts in golden dawn.
Then shrink not, man, nor faint and fear to die;
Life crowns thy death with Immortality.

REMARKABLE CHARITIES.

A FESTIVE season is once more upon us, and benevolent and kind-hearted people will be turning their thoughts to acts of charity, as our ancestors did in bygone days. Our old English charities were very varied and numerous, and in many instances extremely curious, particularly those connected with Christmas. Some account of these gives us an insight into the old-fashioned methods of providing festivities for the poor, all of which methods, however, do not compare favourably with those of the present day.

A kind-hearted man at Burnham left sufficient to provide the inmates of the poorhouse of the parish with a Christmas dinner, with a proper supply of ale, tobacco, and snuff for ever. To the poor of Wokingham town and parish, George Staverton left a sum of money in May 1661, with which was to be purchased a bull. The animal was to be baited, the hide and the offal to be sold, and the proceeds expended in stockings and shoes to be given to poor children. Until the year 1823 the baiting of the animal took place on December 21 in the market-place of Wokingham. In that year the corporation resolved to discontinue the proceeding, which has since therefore been omitted. Attempts have been made on several occasions to restore the savage old custom, noticeably in 1835, when a mob broke open a place during the night where a bull was kept and baited it. A singular usage was formerly in vogue at Princes Risborough, Buckinghamshire, up to about 1813. A bull, a boar, a sack of wheat, and a sack of malt were given to the poor by the lord of the manor about six o'clock every Christmas morning. For a time this was discontinued, and about five or six years later beef and mutton were distributed instead. The origin of this seems lost in obscurity, and the practice whilst it lasted seems to have been productive of much intoxication and riot; the poor paraded the streets during the whole night preceding the distribution with an incessant clamour. In the morning they marched in crowds to the donor's house, and when

the doors were opened, rushed in pell-mell to the feast prepared for them, often inflicting wounds on one another with their knives in their struggle for priority. The custom was finally discontinued on the report of the Commissioners to the effect that they had received no sufficient evidence that it should be maintained as a charitable donation. In the same county, at Drayton Beauchamp was a singular usage known as 'Stephening.' On St Stephen's Day the inhabitants of the village used to repair to the rectory, where they partook of as much bread and cheese as they chose, and drank as much ale as they thought proper, at the expense of the rector! So much rioting was the outcome of this, that the practice was discontinued, and an annual sum of money distributed instead. The payments were stopped, however, in 1827. In the reign of Queen Elizabeth, the venerable vicar of Lidney left the sum of five shillings per annum to remunerate the bell-ringers of Ruardean, Gloucestershire, for ringing a peal on Christmas Eve, about midnight, for a couple of hours, in commemoration of the Nativity.

There is an old charity at Stafford for providing poor people with plums for their Christmas pudding. The rector of Great Barr, in Staffordshire, formerly used to give every person calling at his house on Christmas Day as much beef, bread, mustard, and vinegar as they could eat. A money payment is now given in lieu of the eatables.

An ancient custom exists at Piddle Hinton, Dorsetshire, for the rector to give away on old Christmas Day annually a pound of bread, a pint of ale, and a mince-pie to every poor person in the parish. This distribution is regularly made to upwards of three hundred persons.

In a paper called *The News*, of December 23, 1821, the following announcement is to be seen: 'This morning at eight o'clock, according to the annual custom, a quantity of bread and cheese will be thrown from the belfry of Paddington Church among the populace.' As might be expected, the assemblage on these occasions was immense, and a great scramble took place. This practice, which has long been observed on the

Sunday before Christmas Day, had its origin in the will of two sisters, who, travelling to London to claim an estate, were sorely distressed, and obtained relief in Paddington. On being successful in their claim, they made the above bequest to Paddington.* The charity is now distributed in bread and coals by the clergyman and parish officers to the poor of the district.

In 1611 a provision was made by Leonard Dare for the poor of South Poole to receive a supply of bread. He directed that the wardens of the parish of South Poole should on Christmas Day, Lady Day, St John's Day, and Michaelmas Day, buy, bring, and lay on his tombstone threescore penny loaves of good and wholesome bread, made with wheat, which should then be distributed to the poor of the parish.

A worthy man who had filled the office of sheriff of Hull, by name William Robinson, died in 1708, bequeathing twelve loaves of bread to as many poor widows, to be delivered to them at the side of his grave in Holy Trinity churchyard, Hull, every Christmas Day.

At Bulkely, in Cheshire, the sum of nineteen shillings and twopence was the proportion of certain consolidated charities to which this township was entitled. The mode of distributing it was somewhat peculiar. The overseer had the money changed into pennies and halfpence, and placed in a peck measure, inviting all the poor to take a handful, which was done; but those who came last were very badly off, for they got none.

A man of the name of Henry Greene displayed a whimsical predilection for colours in a bequest he made. In his will, dated December 22, 1769, he left to his sister, Catherine Greene, during her lifetime, all his lands in Melbourne and Newton, in Derbyshire, and after her death in trust, upon condition that there should be given annually to four poor women four green waistcoats, to be lined with green galloon lace, and to be delivered to the women on or before December 21, so that they might be worn on Christmas Day.

The inhabitants of North Clifton were formerly ferry-free. On Christmas Day the ferryman and his dog were indulged with a dinner each at the vicar's; as a little return, the inhabitants presented the ferryman with a prime loaf of bread.

Connected with the parish of Cumnor, in Berkshire, a pleasant custom is recorded. On Christmas Day, after evening service at the parish church, the parishioners who are liable to pay any tithes repair to the vicarage and are there entertained with bread, cheese, and ale. This entertainment is claimed as a right on the part of the parishioners, and is no benefaction on the part of the vicar. Even the quality of the good things which the vicar brings forward is specified. There must be four bushels of malt brewed into ale and small-beer, two bushels of wheat made into bread, and a half-hundredweight of cheese. Whatever remains unconsumed is distributed next day after morning prayers among the poor. The inhabitants of Cumnor seem to have a particular taste for beer, and it enters into another of their old rites. It is not in connection with Christmas-tide, but with the perambulation performed during Rogation Week. The procession on arriving at Swinford Ferry goes across and lays hold of the twig on the opposite shore, to mark that they claim the breadth of the river (Thames) as within

the bounds of their parish. The ferryman then presents the vicar with a noble (six shillings and eightpence) in a bowl of river-water, together with a clean napkin. The vicar takes out the money, wipes his fingers, and distributes the water among the people in commemoration of the custom. The vicarage dues which are collected on this occasion are for the most part diffused in ale amongst the parishioners.

A romantic story concerning doles gained circulation in the Midlands. One of the Leakes, Sir Nicholas, a doughty knight, became, as was the fashion of the day in his time, a crusader, and as a pledge broke a ring with his dame. This simple act formed a quaintly pretty incident, and was the means of the knight's happy reunion with his wife. Whilst away, he happened to be taken prisoner by the Turks and kept in close confinement. His capture was thought to be valuable amongst the enemy as a means to extort ransom, for they believed him to be of noble birth. For several years he remained in prison without the least hope of being released. He fervently prayed to the Almighty to grant him the favour of seeing Sutton once more, and made a vow that if the favour were granted, he would leave a bequest to the poor for ever. Tradition goes on to say that the knight, unknown to himself, found himself within the porch of Sutton Church. He recognised the place as his memory returned, and at once asked the retainers if the lady of the house were yet living. They told him that she was, and that at that moment she was engaged in conferring a dole, as an affectionate remembrance of her lost lord. He wished, naturally, to speak to her; but his garb and general condition were so miserable that she declined to grant his request, and ordered him to be relieved at the gate. He then sent her the broken ring, which she compared with her own half, and the parts fitting exactly, she knew it must be no other than her long-lost lord. To commemorate the event, they agreed that eight bushels of wheat should be for ever baked into loaves on St Nicholas Day and given to the poor of Sutton, Normanton, and Duckmanton.

Many more charities evincing considerable eccentricity and generosity might be cited, such as those for preservation in imminent danger; for divine protection; to promote peace and goodwill; to encourage justice, mercy, and goodness; to inculcate a knowledge of God and our duties to man; to encourage matrimony and provident habits; for early rising, &c. But the above sufficiently indicate the spirit and character of these old charities.

A DEAD RECKONING.

CHAPTER XIX.—CONCLUSION.

Six weeks had elapsed since the events recorded in the last chapter. It was the evening of the return of Gerald Brooke and his wife to the home which they left under such tragic circumstances nearly a year before. Gerald's wound had proved a troublesome one; and after his release from custody, which was merely a matter of a couple of days, he had hurried up to London for the sake of obtaining the best medical advice, and there he had since remained; a few friends had met to welcome the home-comers; there was to

be a grand reception by the tenants and others on the morrow.

First and foremost there was our dear Miss Primby, not looking a day older than when we first made her acquaintance. She had been filling the post of mistress *pro tem.* at the Towers for the past month. She was of an anxious mind, and small responsibilities assumed a magnitude in her eyes they did not really possess, and thereby worried her not a little. She will be thankful when Clara resumes the reins of power, and she herself is allowed to subside into that life of tranquil obscurity in which she finds her only true happiness. There, too, deep in conversation, were Lady Fanny Dwyer and Mr Tom Starkie. Her ladyship was husbandless as usual, but seemed in nowise put about thereby. She and Tom struck fire frequently in the arguments and disputations they were so fond of holding with each other; they agreed to differ and differed to agree, and perhaps were none the less good friends on that account.

Fitting in and out and round about was Margery, spick and span in a new gown and gay ribbons, and a tiny apron all pockets and embroidery. For the first time in her life she had on a pair of French kid shoes, and she could not help stealing a glance at her feet now and again when no one was looking. She scarcely knew them for her own property, so changed an appearance did they present. This evening she was to enter on her new duties as 'our maid' to her beloved mistress. Who so happy as Margery!

The turret clock struck seven, but Mr and Mrs Brooke had not yet arrived. They were to drive down from London, and ought to have been here nearly an hour ago. Every minute Miss Primby grew more fidgety. Some accident must have happened, she felt sure. Perhaps the horses had run away; perhaps a wheel had come off the carriage; perhaps any of twenty possible mishaps had befallen the travellers. Fidgets are infectious, and before long Tom Starkie began to consult his watch every minute or two and to answer her ladyship at random. So many strange things had happened to Gerald during the last twelve months that anxiety on the part of his friends might be readily excused. The suspense was brought to an end by the sudden inroad of Margery, who had been down to the lodge, and now brought word that a carriage and pair had just turned the corner of the high-road half a mile away. This news sent every one trooping to the main entrance to the Towers. Not long had they to wait.

Gerald still carried his arm in a sling, but his other hand was clasped tightly by his wife. Neither of them could speak as the carriage wheeled into the avenue and the old home they had at one time thought never to see again came into view. Nor was there much said for the first few moments after they alighted. A kiss, an embrace, a hand-grip, told more than words: of tears the ladies shed not a few, but they were tears which had their source in the daysprings of happiness.

Dinner was over and the company had returned to the drawing-room. The lamps had been lighted; but so soft and balmy was the evening that the long windows had been left wide open. Outside, terrace and garden and the miles of woodland

stretching far beyond were bathed in a tender sheen of moonlight. Lady Fan was at the piano turning over some music. Mr Tom Starkie was stooping over the canterbury, trying to find a certain piece of Schubert's he was desirous her ladyship should play. Clara and her aunt were talking together in a low voice on the sofa at the opposite side of the room. On the hearthrug, his back to the empty fireplace, stood Gerald. As he gazed on the pretty domestic scene before him, he could scarcely realise that all the strange events of the past year were anything more than the dream of a disordered brain. Could it be possible that only a few short weeks ago he who now stood there, so rich in all that makes life beautiful, had been a hunted felon on whose head a price had been set? Incredible as it seemed, it was yet but too true. If proof positive were needed there was his arm still in a sling to furnish it. His eyes turned fondly to the sweet face of his wife, to which the sunshine and roses of other days were already beginning to come back. How brave, how loyal, how devoted she had been through all the dark days of his trouble! The care and love of a lifetime could scarcely repay her for all she had gone through for his sake. She had indeed been 'that crown of glory to her husband' of which the sage made mention in days long ago.

Clara, who while talking with her aunt had been absently gazing through the open window on to the terrace, suddenly gave utterance to a shriek, and springing to her feet, flung herself upon her husband's breast and clasped him round the neck with both arms. An instant later a pistol-shot rang through the dusk, and the bullet, passing within an inch or two of Gerald's head, crashed into the pier-glass behind. At the open window stood George Crofton, hatless and haggard, his white drawn features distorted by a scowl of fiendish malignity, the light of mingled hate and madness blazing in his eyes. Tom Starkie sprang forward as Crofton, with an imprecation on his lips, raised his revolver to fire again. But quicker even than Tom was a dark-cloaked figure which sprang suddenly into the range of vision framed by the window and dashed the uplifted weapon from Crofton's hand. For a second there was a cold gleam of steel in the moonlight and then the cloaked figure vanished as quickly as it had come. With a loud cry Crofton flung both arms above his head and staggered forward a pace or two into the room. 'Gerald Brooke, you have won the game!' he exclaimed in hoarse accents; then making a clutch at his heart, he gave a great gasp and fell forward on his face. Gerald and Tom raised him. A tiny stream of blood trickled from his lips: he was stone-dead.

The *portière* was drawn aside, and all eyes turned on him who stepped into the room. It was the Russian, looking as cold, pale, and impassive as he always looked.

'Karovsky, have you had any hand in this?' demanded Gerald sternly, as he pointed to the dead man.

'I, my friend! what should I have to do with such *canaille*?' demanded the other with a shrug.

Not more than half a minute had elapsed from the beginning to the end of the tragedy. Under

the direction of Starkie, two or three of the servants who had hurried in now proceeded to remove the body to another room. While this was taking place the Russian drew Gerald aside. 'Look here, Brooke,' he said. 'It is never wise to inquire too curiously into matters when no good end can be served thereby. This man had made up his mind to murder you. It was your life against his. It may be—mind you, I only say it may be—that that fact had come within the cognisance of the Brotherhood to which you and I have the honour to belong. If such were the case, they were bound by their laws to take his life rather than allow him to take yours. But this is nothing more than guesswork. In any case the scoundrel is dead and your life is safe; but it was touch-and-go with you, my friend—touch-and-go.'

The unexpected appearance of Karovsky following so closely on the grim scene just enacted before his eyes revived in Gerald's mind certain apprehensions that had slumbered almost undisturbed for many months. All his fears took flame at once as his memory travelled back to that April evening when Karovsky's ill-omened presence first crossed the threshold of Beechley Towers. What if, at some future day, when all the world seemed full of sunshine, he should suddenly appear again with a message of the same dire import!

Gerald's heart seemed compressed as in a vice as this thought with all its dread significance forced itself on his mind. 'Karovsky,' he said in a dry hard voice, 'now that you are here, there is one question I would fain ask you.'

'I think I can guess the purport of it,' answered the Russian with his imperturbable smile. 'You need be under no fear, *mon ami*, that I or any other emissary of the Brotherhood will ever come to you again with evil tidings. The man who was condemned to die is dead, and although he did not meet his fate at your hands, that matters nothing. The sentence has been carried into effect, and such being the case, by the rules of the Supreme Tribunal you, Gerald Brooke, are absolved in full from ever being called upon again.'

THE END.

THE AMERICAN FIELD FOR EMIGRATION.

MUCH attention has recently been directed in America to what is called 'the Oklahoma boom.' A section of considerable area belonging to the United States in the territory hitherto reserved for the Indians was, after much agitation, thrown open to settlers by order of the Federal Government. In anticipation of the President's action, thousands of people had gathered upon the border of the coveted district; and when his proclamation was published, they swarmed over the dividing-line as fast as railway trains could carry them. Within forty-eight hours, rival 'cities' were putting forward their claims to be the capital of the new territory. There was necessarily some lawlessness. In one, or two instances life was sacrificed in quarrels between persons who claimed

the right of first possession to particular spots; but an orderly government of a crude sort was soon established. Meanwhile, the eyes of the settlers were being opened to the real character of the country. The land proved for the most part to be not of very good quality; the water was undrinkable and the dust unbearable. Thousands of the settlers turned their faces homewards, and for a time the exodus was as rapid as the entry had been. On the whole, however, the district was found to be not unadapted for settlement, and a permanent population will before long have established itself in every desirable locality.

This incident has set serious people in the United States thinking, for it is a striking demonstration of a fact that even those whose business it is to be informed upon such matters have been unwilling to admit—that the *arable public domain of the United States is nearly exhausted*.

The arable area in the United States—that is, the area suited by nature for farming—is usually estimated at 1,500,000 square miles, or 960,000,000 acres. In 1880 the area in farms was 536,081,835 acres. If the rate of increase since that year has not been less than during the previous decade—and there is reason to think it has been greater—the area in farms must now (1889) be over 700,000,000 acres, leaving unoccupied 260,000,000 arable acres, a large part of which is in the hands of railway corporations. In 1885 there were in the hands of the Government 561,623,981 acres of land of all kinds; including the non-arable land as well as the arable. On this point the Rev. Josiah Strong, D.D., General Secretary of the Evangelical Alliance for the United States, says: 'Not only is the area annually disposed of enormous, but it is very rapidly increasing. Even if the increase should cease, the demand for 1884, steadily continued, would exhaust the supply in twenty years. It must not be forgotten that these 561,000,000 acres include the great mountain ranges and all the barren lands. Only a small portion is arable. *The farming lands of the West will all be taken up before the close of the present century.*'

The present population of the United States is estimated at 64,000,000. By the time it reaches 75,000,000, the arable area will all be absorbed in farms. This will give a population of fifty to the square mile of arable land—not a case of overcrowding, certainly, the population of England and Wales being twelve times as dense; but it will bring the people of the United States face to face with a new problem. It is not too much to say that the success of that great nation, the facility with which it has adapted itself to every social and political problem, has been in a large measure due to the possession of an apparently boundless area of virgin soil, free, or practically so, to the settler; and in a still larger measure to the public faith in the limitless capacity of the country for expansion. Questions which vex the minds of statesmen in crowded communities, solve themselves on the vast prairie; and a spirit of harmony and mutual helpfulness is developed in the founding of new territories. When private ownership has locked up all the arable land, the real difficulties of the nation will have begun. We believe the people will prove equal to the new condition of things; our point is, that the conditions will be new, and

in their novelty Canada and, through Canada, Great Britain are concerned.

It is not incorrect, perhaps, to say that the progress of the United States, which has challenged the admiration of the world, has been based upon the development of its great wheat-growing area. Of the forty-eight States and Territories, fifteen may be classed as wheat-growing; and sixty per cent. of the total increase of population in the United States between 1870 and 1880 was in these fifteen. One may well hesitate at attempting to set a limit to the capacity of a country like the United States to absorb and sustain population. Yet it is manifest that expansion in the future will be governed by different laws, now that the arable public domain is approaching exhaustion, from those that obtained when a seemingly boundless area invited all the world to share its rich bounty.

In view of these considerations, the existence in Canada of a vast area suited to the successful cultivation of wheat becomes of great interest and importance. Undoubtedly, the Southern States offer many inducements, as well as a vast scope for the enterprise of settlers; but emigration from north temperate latitudes will for the most part seek a home along the same isothermal lines. Moreover, the greatest possible advantage that a country can offer to settlers is its adaptability for wheat-growing and stock-raising. This the Southern States cannot offer; hence emigration to America may be expected to seek the wheat-growing and stock-raising area of Canada, if they are sufficiently extensive to absorb it and have no serious disadvantages.

It may be premised that Canada has a larger territory than the United States, and fully as great an area of arable land. Such a statement as this would have been promptly rejected a few years ago; and even now it may not be generally accepted without demonstration in some detail. For this purpose the Dominion may be considered in four sections: the Maritime Provinces, the St Lawrence Valley, the Prairie region, and the Pacific Slope.

The area of the Maritime Provinces—namely, New Brunswick, Nova Scotia, and Prince Edward Island—is 32,136,960 acres, of which 18,000,000 acres may be classed as arable. Quebec and Ontario make up the second division—that is, the St Lawrence Valley section, including the region along the great lakes, and as far west as the eastern boundary of Manitoba, having an area of 246,840,320 acres. How much of this ought to be classed as arable cannot be stated definitely; but it is perhaps reasonable to place it, when speaking of the ultimate capacity of Canadian agriculture, at 130,000,000 acres. Much of it will not, however, be occupied until after the Prairie section has been fully taken up. The arable and pastoral area in the Prairie section may be estimated at upwards of 700,000,000 acres.

A Committee of the Canadian Senate was charged with the duty of examining into the resources and capabilities of the Great Mackenzie Basin and the country eastward to Hudson Bay, an area of 1,260,000 square miles, lying to the north of the Saskatchewan watershed. In other words, its observations were not directed to what is ordinarily referred to when the Prairie region

of Canada is spoken of, but to the vast and little-known country to the north. The Committee says: 'That within the scope of the Committee's inquiry there is a possible area of, 656,000 square miles fitted for the growth of potatoes, 407,000 square miles suitable for barley, and 316,000 square miles suitable for wheat. That there is a pastoral area of 860,000 square miles, 26,000 miles of which are open prairie with occasional groves, the remainder being more or less wooded; 274,000 square miles, including the prairie, may be considered as arable land. That throughout this arable and pastoral area, latitude bears no direct relation to summer isotherms, the spring flowers and the buds of deciduous trees appearing as early north of Great Slave Lake as at Winnipeg, St Paul, and Minneapolis, Kingston, and Ottawa, and earlier along the Peace, Liard, and some minor western affluents of the Great Mackenzie River, where the climate resembles that of Western Ontario.'

To a European, it will not seem at all remarkable that a country lying north of latitude fifty-four degrees north has been found to be favourable to agriculture. Half the area of the British Isles, all of Denmark, Norway, and Sweden, a large part of Prussia, and much more than half of Russia, lie north of that parallel. The ideas heretofore received of the climate of British North America have been based upon the condition of things existing on the eastern coast of the continent, where the great Polar Current flowing down through Davis Strait brings ice and cold weather to comparatively low latitudes.

Even in regard to this part of the continent the prevailing opinion in Europe is very erroneous. Quebec, New Brunswick, and Nova Scotia are far from possessing an inhospitable climate. Undoubtedly there has been a change in this respect since the first settlement of the country, to whatever cause it may be due. The average length of the winters appears to be somewhat shorter, due to a slight prolongation of autumn. It is not easy to give a general characterisation to the winters of the eastern provinces which would not be in a certain degree misleading. For instance, the difference between southern New Brunswick and Nova Scotia on the one hand and northern New Brunswick and Quebec on the other is very considerable; also between Quebec and Ontario there are many points of difference. Proximity to the open ocean or to great lakes that do not freeze, the clearing away of forests, and the consequent more rapid evaporation of moisture and earlier melting of the snow, have an ameliorating influence on the climate; while the presence of large forest areas, the proximity of great ice-fields, and the prevalence of north winds, have a contrary tendency. Therefore it is that statements which hold good of one part of Canada do not apply with accuracy to other parts. But speaking generally, it may be said that the winters on the Atlantic coast of Canada are very much more severe than those in corresponding latitudes on the Atlantic coast of Europe; but not so severe, except in the extreme northern parts of the settled districts, as to interfere with the successful prosecution of agriculture.

Mr James Anderson, of Winnipeg, whose father was a prominent Hudson Bay Company officer,

and who himself was born in the Canadian North-west, was examined before the Canadian Senate Committee in 1888. Mr Anderson, senior, was sent by the Imperial Government to search for Sir John Franklin down the Mackenzie Valley, and his son had access to his diary and other observations made by him, extending over a number of years. Speaking of the North-west of Canada, he said: 'There is no doubt that the climate is changing. We have evidence in this country [Quebec] that the climate is changing, and we have evidence of it in the prairies of the North-west.' This observation undoubtedly applies to the whole of North America. As settlement progresses there is less tendency to extremes of temperature; but whether this is due to any other cause than the cutting down of forests and the cultivation of the soil, or whether it is in part due to the same cause as leads to the movement of the Magnetic Pole (as some contend), must remain a matter of doubt.

Many things besides high latitude have to be considered in determining the adaptability of a country for settlement, and of no part of the world is this more true than of Canada. The parallel of latitude which passes along the northern point of Labrador, and south of which lies, on the Atlantic coast, as dreary and uninhabitable a land as is to be found below the domain of perennial winter, when it reaches the valley of the Great Mackenzie passes through a land where strawberries and gooseberries grow wild, and where wheat, barley, and potatoes are successfully cultivated.

Western Europe owes its favourable climate to the Gulf Stream, flowing north-easterly across the Atlantic. A similar current pours in a mighty flood northward along the east of Asia; and its passage to the Arctic Ocean being barred by the near approach of the continents, it swings eastward and, with its accompanying warm winds, impinges upon the western shore of Canada. The great mountain ranges rob it of some of its surplus moisture, and it sweeps through defiles, and passes out on to the plains of the North-west, warm and comparatively dry.

America consists of a great central plain, flanked by two mountain ranges. This plain has a gradual descent to the north over the greater part of its area. Where the Union Pacific Railway leaves the plain to enter the Rocky Mountains, it has for a distance of fifty miles an average altitude of five thousand feet. The corresponding portion of the Canadian Pacific Railway is not more than three thousand feet above the sea-level, and the decrease continues until at the valley of the Peace River—that is, in latitude fifty-six degrees—the altitude is not more than one thousand feet.

Another effective cause of favourable summer temperature is to be found in the length of the days. Long-continued sunshine seems to be especially propitious for farming. Vegetation is much more rapid in latitudes where the days are long—that is, of course, where the other conditions are favourable—than in places where the days are shorter. At Fort Simpson, which, it is alleged, is within the limit of wheat-culture, there is scarcely any difference between night and day in mid-summer.

Concerning the winter temperature of this part

of Canada, there appears to be a necessity for a radical revision of popular belief. We refer now not to Manitoba and the territories along the Canadian Pacific Railway. It is well known that in the portion of the Dominion last referred to the winters, though not so long as those in Quebec and parts of New Brunswick, are more severe, especially in the duration of 'cold spells,' from which fact the conclusion has been drawn, not unnaturally, that in regions farther to the north the cold must be too intense and prolonged for the country ever to become thickly peopled—that, in short, even if the land is fertile and the summer temperature favourable for farming, the lowness of the temperature and the frequency of great storms during a period of six months every year practically close it to any class of emigration except that from high latitudes. The evidence taken by the Senate Committee above referred to presents the case in a new and favourable light. 'The winter temperature at Fort Simpson'—which is about as far north as any claim is made for successful farming—is about the same as at St Petersburg,' says one witness. 'The winter is about the same as in Ontario,' says another, referring to the Peace River and the Liard Valley. Such testimony could be multiplied; and while it is premature to say that the adaptability of the district for settlement by emigrants from the north temperate sections of Europe has been placed beyond a doubt, the importance of the bearing of the question upon the development of the Dominion will be conceded. If, upon investigation, it shall be made clear that the whole region between Fort Simpson and the United States boundary is adapted to wheat-culture, and possesses much the same winter climate in all its parts, our views as to the food-producing capacity of Canada, and its resulting capacity to support population, will be greatly enlarged.

Doubtless, in common with every other land, the country has its drawbacks, some of which will be overcome in time, while others are insurmountable; but on a fair balance being struck between advantages and disadvantages, it will hold its own in comparison with any part of the continent. One of these drawbacks is the occurrence of summer frosts. Apart altogether from the probability of the cessation of these as the country becomes settled, there seems to be no doubt that the extensive experiments being carried on by the Dominion government will lead to the introduction of a wheat which will come to maturity in a period short enough practically to remove all danger of loss from 'frosted' grain.

Concerning that part of British Columbia which lies west of the Rocky Mountains, much has yet to be learned. No one can presume to speak definitely of its capacity, from an agricultural standpoint. Apparently, the greater part of its area is mountainous, and not adapted to farming; but there are extensive areas which are highly fertile, and others yet more extensive which furnish grazing-lands of special value.

The existence of this immense domain in Canada adapted to agriculture and stock-raising, and as yet for the most part in the hands of either the Federal or the Provincial Governments, taken in connection with the rapid exhaustion of the

arable public domain in the United States, must have a potent influence upon the development of the North American Continent during the next quarter of a century.

CHARLIE RANSOM.

A STORY OF THE OIL COUNTRY.

CHAPTER IV.—CONCLUSION.

JOHN BURLINGTON was not killed, for the nitro-glycerine can which had lain in the bottom of the boat was an empty one. Had it been full, there would have been enough of the explosive to destroy an ironclad steamer. As it was, there was quite sufficient of the greasy substance adhering to the sides of the can to kill a hundred men; and yet John Burlington cheated death. But he was terribly battered and bruised, and his legs were fearfully lacerated. Had it not been for the prompt assistance rendered by Captain Jerry Jones, who boldly plunged into the icy water, the poor fellow must have been drowned, for he was completely helpless. Kind hands carried the wounded man to his room in Tommy Van Horn's house, while Ted Robinson mounted Burlington's own horse and galloped all the way to Mesopotamia for Doctor Leslie. It was a 'close call' for John Burlington; but surgical skill and tender nursing speedily placed him on the road toward recovery.

And while anxious hearts stood about Burlington's bedside, the wretched fellow who might have prevented by a word all this sorrow and pain and trouble kept himself locked up in the little room where so recently he had experienced the supreme happiness of his life. The pretty curtain, fastened by the dainty bows of red ribbon, still spanned the window, and the steel engravings hung upon the whitewashed walls precisely as Marie had placed them. Even the little glass vase was upon the table, and beside it stood the Oxford frame containing the school teacher's photograph. But Charlie Ransom was ashamed to look upon even that lifeless portrait of the woman he had so deeply wronged—the woman whose more than kindness to him he had repaid by permitting the man who was almost her husband to rush unhindered to his death. For on that first day, when Ransom hurried home and locked himself in his room, he did not know that Burlington was still alive. He had seen his victim—for such he now deemed Burlington—taken from the water and carried to his room; but he had not waited to learn the exact effect of the explosion. So, alone with himself and his sternly accusing conscience, Ransom felt that the brand of Cain was upon him, that he was a murderer of the deepest dye. For, now that his revenge had reached its fearful climax, he was overtaken by remorse—a passion that operates more keenly, and is harder to bear than jealousy and a desire for revenge. He now viewed his action, or inaction, upon the river-side very differently from what he did when he failed to warn Burlington of his danger. He saw, when it was too late, that it is quite possible for passive indifference to be as guiltily fatal as active wrongdoing.

In the evening Mrs Jones called Ransom to supper, but he gave her no answer. Later on she tapped at his door, but he said that he was not hungry. Then, as a thought struck him, he opened the door a few inches and asked: 'What do they say about Mr Burlington?'

'Jerry's just been over. The doctor's come; and the poor dear man's alive, and that's all. Jerry'll go down to Van Horn's again in the morning.'

Alive! Then there was some hope, and he might not be an actual murderer, after all. But he *was* a murderer; for if John Burlington did not die, that made no difference to the murderous desires that had so lately dwelt in his heart. Besides, Burlington might die yet: he was only just alive, and the doctor might not be able to save him.

All through the night Charlie alternately paced the floor or threw himself into the wood-seated chair that Marie had so often occupied when she played to him on the banjo. When the gray light of the chilly morning dawned, he listened intently as Captain Jerry left the house. When the Captain returned to his breakfast, Ransom opened his door and inquired: 'How is he?'

'Very low,' was the ominous reply.

Again he closed the door; and all through the long hours of that day Ransom stayed in his room, declining food and refusing to see any one. The long hours dragged wearily and painfully, and the wretched fellow suffered the most excruciating agony of mental torture.

At noon, the doctor's bulletin was much the same as in the morning; but at supper-time Mrs Jones did not wait for Ransom's eager inquiry. She had seen that Charlie was taking the accident sadly to heart, though she wondered why, so she hurried to the door of the little room. 'Charlie!'

'What is it? What news?'

'He is better; he will pull through.'

'Better?' he asked in a tone of voice which would have risen to a shout had it not been for his bated breath. 'Better? You are sure there is no mistake—it is what the doctor says?'

'There is no mistake; the doctor has every hope.'

'O my God, my God!' sobbed the poor fellow, suddenly relieved from the crushing weight of responsibility for the loss of a valuable human life. 'O God, forgive me!' he prayed, while tears coursed down his cheeks. Wistfully he gazed, though dimly, at the picture in the Oxford frame. 'Marie, he sobbed, 'I must tell you all about it—perhaps you will forgive me—perhaps, perhaps!'

Then, with the photograph still in his hand, he flung himself upon his hard bed and, like a tired child, cried himself to sleep. When the Doll awoke it was almost noon of the next day. But he felt much refreshed, and he was firmly resolved upon making a full confession to Marie Reese. He washed himself and swallowed a cup of tea which Mrs Jones prepared for him, and then he started out. He knew where he could find Marie, for he rightly expected that she would not neglect her school duties now that the chances for Burlington's recovery were fairly good.

At twelve o'clock, when the scholars were dismissed for dinner, Ransom entered the school-

room. Miss Reese was herself pale and weary ; but she was positively shocked by the Doll's miserable appearance. His haggard face bore distinct traces of mental anguish and of recent tears. 'Why, Ransom,' she said kindly, 'what is the matter? You have not been ill again surely? Sit down.'

The schoolmistress was the only person left in the room when Ransom entered, and she was putting on her hat to go. But she laid it aside as she spoke, and gently pushed her chair toward her visitor.

'No, marm ; I will stand. Please sit down yourself ; and—and—for God's sake, Miss Reese, don't talk kind to me or—or I shan't be able to tell you what's on my mind.' And as he spoke, Ransom gulped down a sob that almost got the better of him. 'The Lord knows, Miss Reese, I want your good opinion, for it's the sweetest thing as ever I've known. But I don't want it if I don't deserve it ; that is to say, I know I don't deserve it ; but I don't want to get it by no false pretences. I'm bad and wicked—oh yes, marm ; wait and judge for yourself—and I want to tell you all about it. And then, why, if you'll forgive me *then*, I shall go away from this place happy, marm ; and I shall bless you, and pray God to bless you, day in and night out.—Now, if you'll be so good as to listen for five minutes, I'll tell you the whole story.'

'When I first see you, marm'—Ransom relapsed into his old careless river-style of talking.—'I thought you might be a angel ; I did indeed. I knew as I was only a poor no-account river roustabout what couldn't hardly read or write, and scarce talk straight ; but I judged there was no harm in sort of admiring and worshipping a angel. And so in a quiet way, at a respectful distance like, I worshipped you, marm. And then you 'lowed me to come to the school, and you took a fancy to help me along, and was kind and patient with me. As also, you liked to have me drop in once in a while at Captain Peter's and talk to you 'bout the river and sech. Then we took them skating trips down the creek, and you let me give you some skates and taught me all the fancy figures on the ice. And 'long about that time I forgot that I was only a poor dunderhead of a river-lad, and that you was my good angel. Instead of just keeping on a-worshipping you, Miss Reese, I made a fool of myself and—no ; don't be angry at *that*, for I couldn't help that part of it—I loved you like—like—well, like Mr Burlington loves you. And then, when I couldn't make up my mind what to do about it, I fell sick, and you came to see me. You was very kind—you've allus been kind to me—and brought me things and played for me and sang to me, and, yes, you kissed me.' I know, I understand now, marm ; it was just pity and friendship ; but I didn't know then—perhaps I didn't want to know. But after that, I thought for *sure* that you really did care for me—the same as you care for Mr Burlington. So I was happy. But then Mr Burlington came, and he was kind and generous, just like you, marm. But the kinder he was and the pleasanter he was the more I hated him, because he had what I could never get. Yes 'n, I hated him, and wished him dreadful things ; and that day—last Monday—I seen him get into the boat, and I seen the tin can, and I

knew well enough it was glycerine, marm. But I never says a word—just let him go on, and—Well, marm, you know the rest.'

When Ransom paused, Marie was trembling like a leaf, while upon her face those who knew her well could have read signs of indignation, grief, and disappointment.

'This is true, I suppose?' she said in a voice that was none the less hard and cold because of a tremulous quiver.

'Yes ; it's all true, every word.—But oh, Miss Reese, forgive me ! Please, please forgive me ! I am sorry, truly sorry. I have already suffered more than you will ever know, and my punishment will never quite leave me. I would do anything, give anything, to undo that day's work.'

'Ah,' she said, in the same cold tones, 'the more I think of it and recollect what might have been the result, the more horrible it seems. And *you*, above all people ! Your love for me must have been of a very curious quality ;' and she laughed a hollow little laugh.

'Don't, please don't, Miss Reese. I know I have deeply wronged you ; I know I deserve your hatred and your curses, and yet—I ask your forgiveness. In two days the *tem* goes down to Oil City, and I shall go with her, but I shall never come back to the Valley. I will try never to cross your path any more, only please forgive me.' The Doll, cap in hand, knelt with bowed head before the schoolmistress as he pleaded for her merciful judgment.

'No, Ransom,' she said ; 'you ask too much. God may forgive you ; perhaps I may some day—but I cannot now. Please leave me.'

So unforgiven, the Doll left his old friend and teacher ; but that night, when Marie Reese laid her head to rest upon her pillow, she resolved to send for Ransom the following afternoon.

The success of the 'shooting' at Captain Peter Lamson's well had given an impetus to the dynamite man's business. All the owners of unsatisfactory wells had them immediately 'shot ;' and within two days after the accident to John Burlington, seven or eight wells were throwing huge fountains of oil which it was impossible for a time to control. This oil, which was nearly all wasted, flowed in every direction about Pan Handle City, finally finding its way to the Tomhicken Creek. Meanwhile, locomotion was difficult, and where practicable, exceedingly disagreeable ; for some of the streams of crude oil were as much as ten feet wide and several inches deep.

On the night that Marie Reese went to sleep regretting her harshness toward the Doll, Mrs Lamson was relieving her friend, Mrs Van Horn, in the care of John Burlington ; and toward midnight Captain Peter was called out by one of his workmen from the South Side Well on account of an accident having happened to the derrick. This left Marie quite alone in the Lamsons' house, which was rather isolated from the other residences, none of them being built very closely together in Pan Handle City. The nearest house to Captain Peter's was Jerry Jones's, perhaps two hundred yards distant. That evening Marie had been carried home in Peter Lamson's strong arms, for the house was completely encircled by a little torrent of petroleum on its way from a 'gusher'

to the river. The house stood upon a small and slight elevation, which, being directly in the course of an overflow of waste petroleum, divided the stream into two currents, each of them six or seven feet wide. These joined their forces once more just below the house, thus temporarily transforming the hillock into a little island.

In the dead of the night, from some unaccountable cause—in the oil regions the origin of a fire is never discovered—a fire broke out near the very well from which the stream flowed around Peter Lamson's house, and in less than one minute a mighty river—or wall—of fire, ten feet wide and ten feet high, was rolling onward toward the Tomhicken.

It had come to Pan Handle City at last—one of those fearful fire-scourges, immunity from which is guaranteed to none of the oil towns and villages; and it had come, as they usually do, when the men were least prepared to combat it. Except one or two watchmen about the wells which needed especial care, and Captain Peter, who was across the river, all the people were sleeping, unconscious as yet of the awful danger that more than threatened them. No, not quite all. Stretched upon his sleepless bed in Jerry Jones's house was the Doll. Through the curtained window he perceived the lurid glare of the terrible roaring fire, and as quickly as he noticed it he saw that it was rushing on in its relentless fury toward the house where Marie Reese lay sleeping. He sprang quickly up, and, shouting 'Fire!' as he rushed through the house, ran as fast as he could over the distance which intervened between him and Peter Lamson's. This did not take much more than a minute; but the fire was ahead of him, and was roaring around the doomed house like a whirlwind. The heat was terrific, and the temperature inside the house must have been equal to that of an oven. But Ransom cared nothing for that. He had often thought he would like to prove his love for Marie Reese by laying down his life for her. He had always meant as much as that—he meant it yet.

So he darted through the wall of fire whose cruel flames peeled the skin from his face and hands, while it made his hair singe and curl. With a blow he battered down the light door and rushed up the narrow stairway, at the head of which stood Marie, trembling from fright and almost fainting with the heat. She had hastily enveloped herself in a dressing-gown. The heat was stifling, and Ransom knew that he must hurry or both of them should be burned to death. He pulled a large handkerchief from his pocket and tightly tied it about Marie's ankles, outside her wrapper; then he took off his own thick coat and threw it over the girl's head and shoulders, buttoning every button. 'Keep quite still,' he said, in tones which forbade all demur or argument. With something of his old-time vigour, he took Marie in his arms as if she had been a baby, and carried her down the steep staircase out into—yes, through the sea of fire, and laid her beyond the reach of the flames, unhurt except for her scorched hands.

And Ransom? Ah, for poor Ransom the double trip through the flames had been too much, especially the return journey, for he wore no hat, and his coat he had wrapped about Marie.

When he laid his precious burden down, his hair and eyelashes were singed to a crisp and his shirt-sleeves had disappeared. He was burned fearfully, and what the men carried in a blanket up to the little bedroom was more like a cinder than a human being.

It was the evening after the fire that had destroyed Captain Peter Lamson's house, and sad hearts lingered about Jerry Jones's shanty; for in the little side bedroom Charlie Ransom lay dying.

There was not the slightest hope for the poor fellow, and perhaps it was better so, because, had he possessed sufficient vitality, he must have passed through days and weeks of terrible pain before he could possibly have recovered. His poor scorched and bruised body was blackened by smoke, while the baked skin had peeled off his face, arms, and hands, leaving them raw and sore. The curly flaxen locks were gone, and the large blue eyes were now bandaged with lint and petroleum grease. His mind was wandering, and once or twice the cracked lips parted to murmur of the red can, of Mr Burlington, and of the schoolmarm.

Late in the evening, Ransom became rational, and he lay quite still. Not a single complaint or word of reproach escaped him; but about ten o'clock those who watched and listened heard him feebly ask for 'Miss Reese.' So they called Marie, who was in the adjoining room, to step to the bedside.

The girl was miserable enough at the thought of her harsh words spoken to the Doll when he so earnestly pleaded for her forgiveness, and her tears flowed fast at the sad sight which her plucky deliverer now presented. Her own hands were bandaged, so she could not well touch Ransom's if she had dared to, but—as she had done only a few short weeks before—she bent over and lightly kissed the poor burned forehead.

Charlie knew quite well who it was, for painfully and slowly he whispered: 'You will forgive me?'

'My poor boy, yes, oh yes!'

There was a pause of some moments, during which the silence was intense. Again it was broken by the Doll: 'Miss Reese.'

'What is it, Charlie?'

'For—the—last—time—you—you will sing—for me?'

'I will try,' she said with a sob. 'What shall I sing?'

'The—heavenly—mansion piece.'

The banjo stood in its old corner, and Marie sorrowfully took it up. Her feelings well-nigh overcame her, but for the dying lad's sake she restrained them, and as she picked—awkwardly enough with her bandaged hand—the simple prelude to the old hymn, Ransom's scorched lips parted with a sad smile of satisfaction. And then she sang:

My heav'nly home is bright and fair;
Nor pain nor death can enter there;
Its glittering towers the sun outshine;
That heav'nly mansion shall be mine.

Let others seek a home below,
Which flames devour, or waves o'erflow;

Be mine a happier lot—to own
A heavenly mansion near the throne.

The next morning, when the sun rose over the Alleghenies and shone down upon the Tomhicken Valley, Charles Ransom had for ever left Pan Handle City.

EXPERIMENTS ON MODELS OF SHIPS.

In a recent number of this *Journal* we gave an account of a method of experimenting on models of estuaries, by means of which harbour engineers may get some indication as to the probability of the success of intended harbour works. In the present article it is proposed to show how experiments on models of ships may afford guidance to naval architects in designing real ships. The problem is often presented to shipbuilders, how to build a vessel capable of running at a certain high speed; and when there are, as is usually the case, other conditions to be accomplished—shallow draught, large carrying capacity, and a strict limit of price and time—the problem becomes by no means an easy one to solve. No doubt, shipbuilders who have had large experience in building somewhat similar vessels can often hit off very tolerably what is required by imitation with moderate variation; but there is always considerable risk of failure. Disappointments often occur entailing loss to the shipbuilder or ship-owner, sometimes to both.

The late Mr William Froude introduced a method for experimenting by means of models accurately made to scale, in order to find out what speed can be advantageously got in the real ships. He used a simple rule founded on hydraulic principles for determining at what speed a model ought to be driven in order to get the same 'stream-lines' as in the real ship, and in order that the waves caused by its motion through the water may be proportionally the same in size and shape. This rule when tested by actual experiment was found to give true results. According to this rule—which is often called Froude's Rule—the speed of the model ought to be to the speed of the real ship in the proportion of the square root of the length. Thus, for instance, if the model is ten feet long, and the real ship forty feet, the speed of the model ought to be half the speed of the ship. The resistance in the model is to the resistance of the real ship in the proportion of the cube of the dimensions. In the case supposed, the model being a quarter the length of the real ship, the resistance of the model will be $\frac{1}{4} \times \frac{1}{4} \times \frac{1}{4} = \frac{1}{64}$ of the resistance of the real ship.

In the year 1868, Mr Froude proposed to the Admiralty that they should construct a large tank fitted up with apparatus for the purpose of conducting accurate experiments on models of war-ships and other government vessels; and a tank was accordingly constructed soon after at Torquay, where Mr Froude personally superintended the experiments. The models were made of paraffin wax, and were generally twelve feet

long, it being found that models of that size yielded very reliable information as to what would be the behaviour of the real ships; while smaller ones could not be depended on to give exactly corresponding results. The models were cast in moulds made of clay, and were then carved down to the exact shape, this being accomplished by the aid of an ingenious mechanical contrivance. The tank was two hundred and seventy-eight feet long, thirty-six feet broad at the top, and ten feet deep. A light railway supported from the roof ran along the whole length of the tank over the water at a height of twenty inches above the surface. On this railway a small truck could be drawn from end to end by a steam-engine. The models were towed through the water by this truck.

In order to get a record of the exact speed of the model during the experiment, and the force required to tow it at that speed, a small paper-covered cylinder and a pen were fitted up in such a way that the line traced by the pen indicated both the speed and the force. This indicator was mounted on the truck, and the cylinder was turned by a band from a pulley on one of the axles of the truck; while the pen, being attached to a sort of spring-balance in what may be regarded as the tow-ropes, was moved backwards and forwards along the cylinder according to the force applied, so that the distance traversed by the model and the force applied in towing it were thus recorded. Time was indicated by another line drawn on the same cylinder by a pen which received a jerk from a clock every half-second. The diagram, then, drawn by this indicator showed exactly what force was required to tow a particular model at a certain speed; and by comparing the diagrams got by towing the model at different speeds, and also by comparing the diagrams produced by models of various shapes, valuable practical results were obtained.

It was found that the resistance as indicated by the force required to tow the model varied greatly with slight modifications in the form of the vessel. As the models were constructed of paraffin wax, the form could, without much difficulty, be modified until a satisfactory result was attained. Sometimes a model which at first sight appeared well designed proved unsatisfactory when tried, on account of the character of the waves which it produced in moving through the water; and a slight alteration of the form was found to give much better results. Besides the exact information as to speed and resistance obtained from the diagrams of the indicator, the experimenter could also learn much that was interesting and useful about the comparative merits of various forms by watching the waves produced in each case as the model moved through the water, the truck being made sufficiently large and strong to carry the observer. The importance of thus observing the position and shape of the waves is most essential in designing a quick paddle-steamer, because a form of vessel otherwise quite satisfactory for speed may happen to produce the hollow of a wave just at the place where the paddle-wheel is intended to act on the water, and this may interfere very seriously with the action of the paddle-wheel. By experimenting on a model, the form of the vessel may be modified a

little so as to shift the hollow of the wave to some other position along the side of the ship, thus allowing the paddle to work advantageously.

Much valuable light has already been thrown on difficult problems in naval architecture by means of such experiments on models; and further discoveries and inventions may be expected to follow.

The Admiralty tank experiments are still carried on. After the death of Mr Froude it was considered that a tank at Gosport would be more convenient for naval officials than the original one at Torquay, and a new one was accordingly constructed there instead, to which the experimental apparatus was removed. Here Mr William Froude's son, Mr R. E. Froude, conducts the experiments with the aid of a staff of officials. Only one private firm of ship-builders has as yet been enterprising enough to construct an experimental tank, namely, Messrs William Denny & Brothers of Dumbarton. There are, in fact, as yet only these two in our country—the one at Gosport and the other at Dumbarton. The Italian Government has just started a similar tank at Spezia.

It would be very desirable that more of these experimental tanks should be constructed, our Admiralty one not being available for ship-designers among the general public. If tanks were constructed in various important shipbuilding centres throughout the country, and if arrangements were made whereby naval architects could get their new ideas experimentally tested, great advances might be expected to ensue in the science of shipbuilding.

'BUS DRIVERS.

It, as Shelley hath it, poets are the unacknowledged legislators of the world, the driver of the 'bus is the acknowledged monarch of London's world on wheels. Mounted on his box, with 'regulars' to right of him and 'regulars' to left of him, he is in his element, and fears neither friend nor foe. Especially in the bright summer days is he in his glory, as in brand-new suit—including the tall white hat—he skilfully drives his lumbering vehicle through the mighty maze of traffic. It is like a ship in full sail, with the parasol and the popular *en tout cas* for the canvas. You have the surging motion, too, to strengthen the illusion. This is particularly observable when, in passing the 'bus of a rival company, your topheavy conveyance almost topples over as, skidding on the tram-lines, it struggles to right itself.

'Bus drivers pay special attention to their pipe and their horses; and their language is not over select if when the change in the latter is made they happen to get a duffer either on the on or off side. They vent their spleen during the rest of the journey, casting contemptuous looks at the poor beast, which, is perhaps now making almost its last run. But most of the horses engaged in the traffic reflect credit on the owners, seeing what heavy work falls to their lot; and in the

main they are exceedingly well used by the drivers. The whip is more for ornament than use, and when made use of it is in the gentlest manner.

Although the conductor figures in many respects as the leading man of the twain, the functions of the driver are more varied, interesting, and important. Generally speaking, he looks on the man at the back with a sort of contempt, and woe to the conductor who offends his 'whip.' The driver can cause the conductor's takings to reach a very respectable figure, or be the means of reducing them to the lowest on record. A good driver will always be on the *qui vive* for customers, and in his prominent position, sees them long before the conductor is cognisant that clients are in waiting. A touch with the whip notifies the conductor; and from the side on which play is made therewith, so it is known where business is to be looked for. But for the driver, too, many of those who patronise the box-seat would be able to slip off without paying, for at certain points *en route* the conductor is so busy behind that he cannot observe all that goes on in the 'front of the house.' The whip is again the vehicle of communication, and the conductor is on the alert. Again, the whistle or bell which is the means of asking the driver to stop or proceed may be attended to with alacrity or the driver may work awkward. For instance, he is asked to stop; but the driver goes heedlessly on, and has proceeded so far before he can be induced to pull up that the conductor loses a fare. Or a driver may cause much inconvenience and annoyance by starting before the signal is given. And so on *ad infinitum*. Another point in this connection is that a driver usually drives the same 'bus for years, and comes, therefore, to look upon the vehicle much as a captain does on his ship. The conductor is in a sense an interloper, and must pay for the privilege of working with him.

If the driver of a 'bus is not a man of intellect, he is at anyrate an interesting personality, and you may gain both pleasure and profit by sometimes riding by his side and listening to his terse remarks. He is generally brief, sometimes witty, and often original. In a general way, long hours notwithstanding, he is content. An old driver will lament the halcyon days—the days of the past, when high charges were the fashion. 'We don't make what we did then,' he says; 'nor do we get such a good class of people,' he adds. He evidently hardly relishes the plebeian penny, although himself a 'pleb.' But he is pleased with the patronage of the ladies who ride outside. Occasionally, one rides by his side, and if she is of genial temperament, he lays himself out, if not to mash, at least to please. He is full of information, and his rubicund countenance beams with delight. He will point this out and that, and if the lady is interested in horses, will tell her the names of those he is driving. If his fair companion is a stranger to London he will act as guide, so far as he is able, by directing her attention to buildings or localities of interest which lie in the way. In many instances, he will relate with gusto incidents connected with the subject of his remarks. It may not be all according to Cocker; but what of that?

From the nature of the employment and the

very long hours, it follows that a driver, sees little of his home or family. Seven days a week find him on his 'bus. But it should not be thought that the driver takes no interest in his domestic life. On the contrary, he is usually a married man, with a comfortable home and a respectable wife and family. In some cases, drivers own the houses in which they live, and there are men in London engaged in this work who own several houses. One way and another, a driver does very well. Very pleasing, too, is it to see one of the better class of drivers, accompanied by his wife on a Saturday night—his wife, that is, visiting her better-half at his own, almost, one might say, residence—his 'bus. She is on the knifeboard, and they are settling that very important question, what shall be had for the Sunday dinner.

But with the departure of the summer, this very pleasant aspect of a 'bus-driver's life ceases to obtain. No ladies outside to brave the frost and snow, and the box-seat as often empty as not. Cold, despairing fog, and gloomy mist now reign triumphant. But the driver is still strapped above, and, as of yore, skilfully guides his four-footed co-workers through the busy streets. He is now closely muffled up, and sundry nips of brandy and whisky are the order of the day and night. Yet he budges not, but bravely, in face of the driving sleet, the keen cutting wind, or the blinding snow, holds on to his reins. It is very hard work now, for the horses may fall at any moment, and at times require all the driver's strength to keep them on all-fours. This is the weather to discover the weaklings, and you cannot help asking at such a time whether it is absolutely right to employ men for so many hours a day.

A monarch above, when he reaches the flags below, the driver is a very ordinary man indeed. In his proper element he loomed large in your eyes; but on the flat he seems a veritable *reductio ad absurdum*. He is like a constable out of uniform, or a sailor on shore. Above, all his movements indicated a master of the craft; but below, he is a minnow among the tritons. But our friend always gets down for a purpose, and on this occasion it is for dinner. He has a whole twenty minutes to spare! Let us therefore leave him in the full enjoyment of the gastronomic function, only remarking that 'bus drivers seem possessed of marvellous digestive powers and iron constitutions.

THE MONTH:

SCIENCE AND ARTS.

THE authorities at South Kensington Museum have recently adopted a new system of water-supply under pressure in order to protect from fire the priceless treasures of which they are the guardians. The ordinary pressure upon the water-mains is not sufficient to force a jet to the higher portion of these extensive buildings, and it was at first contemplated to build a tower crowded with a water-tank, in order to obviate the difficulty. But as the erection of such a tower is a work of considerable time, the new method to which we refer has been adopted as a tem-

porary expedient. This is the high-pressure system invented by Mr M. Vinning of London, and consists of a vessel of compressed air which acts upon a closed tank of water with a capacity of two thousand gallons. The pressure upon the water amounts to about one hundred pounds on the square inch, and it is estimated that in the event of fire the quantity of water held by the tank would be sufficient to serve two powerful jets for about ten minutes, by which time the ordinary fire-engines would presumably come into play. Every one knows that the best way to cope with a fire is to battle with it immediately on its outbreak, and this new apparatus seems effectively to meet that requirement.

The cruelty to horses of using a bearing-rein, which is irritating to this highly nervous animal, and prevents him regaining his footing should he slip—and slipping is frequent on the now common asphalt roads—has been again and again demonstrated, but nothing is done to check the evil. A correspondent of the *Times* suggests that some well known leader of fashion should take up the question, and by his or her example endeavour to destroy a cruel custom, which means much torture to horses, and seems to have no compensating advantage of any kind whatever.

An American paper suggests that plates and dishes used on board ship should be fitted with iron bottoms, so that by means of electro-magnets placed beneath the table they might be held firmly in place during the rolling of the vessel. As our readers know, the slipping of the table utensils is at present guarded against by the use of wooden rails, and perhaps, all things considered, this simple device is better than the one now proposed, in the carrying out of which many difficulties would present themselves. The new expedient seems to have been suggested by the alleged malpractice of certain transatlantic gamblers, who have cleverly taken advantage of the resources of science to help them in their nefarious doings. These men, it is said, use dice so loaded with iron upon one face that they will always fall in one direction upon a table furnished with concealed magnets in the manner described.

Photographers, both professional and amateur, are discussing the merits of a new developing substance for gelatine plates which has recently been discovered by Dr Andresen of Berlin. The new substance is a grayish powder called Eikonogen, and it is claimed for it that it will bring more detail out of a plate which has been exposed instantaneously than any developer previously known. It remains to be proved whether this be true or not; but it is certain that some prominent workers believe that there is a future before this new agent. It has certainly the merit of being extremely clean in working, for it leaves no stain on the hands, and it has the further advantage of being of a non-poisonous nature.

The 'Temple of Heaven' at Peking, recently destroyed by fire, was held so sacred by the Chinese that no European, however influential he might be, was ever known to have obtained permission to enter its precincts. But in spite of all restrictions, an adventurous Englishman in the person of Mr George Forbes once managed by sheer insistence not only to enter the building, but actually to take photographs of its interior;

and he has recently published an interesting account of the manner in which he, in company with a Danish gentleman, undertook this risky work. The temple was surrounded by three walls with moats, and after climbing over the first of these, the two friends actually had the audacity to command the guards to let them into the building, and to open certain windows so that sufficient light could be obtained for their photographic operations. The guards were so horrified at the presumption of the strangers that they yielded to the besiegers, and did their bidding. The travellers were rewarded with photographs which are probably unique.

Professor Von Bergmann of Berlin is said to have lately conceived and carried out an operation which must be considered a marvellous tribute to the progress of modern surgery. Two patients were brought to him, one of whom was suffering under an injury which necessitated amputation of the thigh, and the other from a disease of the humerus which called for excision of a part of that bone. The Professor proceeded to operate upon the first of these patients, and he then removed the diseased portion of the bone from the arm of the second one, leaving necessarily a gap. This he actually filled with a portion of the healthy bone from the amputated leg, and a successful union was made. The second patient was by this clever operation endowed with a serviceable arm, instead of one which would probably have been useless.

A new use for the electric light has been proposed as a help towards street traffic in the fog season. It is suggested that an incandescent light, fed from a battery in the vehicle behind the animal, should be placed on the forehead of a horse, so that a brilliant ray should be cast in front, as a protection to pedestrians. We fear that the suggestion if carried out would lead to disappointment, for experiments have shown that even the brilliant arc light will not so readily penetrate a foggy atmosphere as will a light of apparently far feeble power, such as that obtainable from oil or gas. An incandescent light of the kind proposed could be of but two or three candle-power, unless a very cumbersome form of battery were carried in the vehicle to furnish it with the necessary electrical energy.

At many places on our coasts sea-water is now used both for flushing the sewers and for watering the roads, and in the latter work it is found to have a binding action upon the dust particles which reduces their tendency to rise in the wind after the water has evaporated. In a seaside resort at New Jersey they are using this system with the addition of a simple apparatus which is self-acting, and which raises the water from the sea to a storage tank. This apparatus is worked by the motion of the waves, and consists of a kind of swinging-door which is hung between two of the piles of the pier. As this door oscillates by the action of the waves, it communicates its motion to the pistons of a pump, and the water is thus raised to the level required.

Mr James Fairlie of Glasgow, who tells us that he has had twenty years' experience of sea-life, sends us an account of an improved port which he has patented, and which is designed for use in sailing-ships and well-deck steamers. It can be fitted to any ship which has ports of

the ordinary pattern, and presents advantages which we should think will lead to its extensive adoption. The ordinary ports of a vessel, through which water shipped in heavy weather makes its escape from the deck, are flush with the bulwarks; but in this improved model the port protrudes through the bulwarks at an angle, and is therefore furnished with side-pieces and a bottom. This bottom or floor is so balanced by an adjustable weight that it remains in its normal state closed, so that no water can enter from the outside. But when water rushes into it from inside the ship, the action of the counter-weight is overcome, and the bottom opens to let it out into the sea. The inner side of the apparatus is furnished with an iron grill, so that small articles such as ropes and the like cannot escape with the outrushing water. The contrivance can further be drawn in so that it is flush with the bulwarks when the vessel is in harbour and the ports are no longer required.

The seventh Report of the Board of Trade on the working of the Boiler Explosions Act of 1882 furnishes some interesting particulars concerning the accidents which have taken place from this cause during the twelve months ending in June last. We learn from this Report that in the period indicated thirty-three persons have been killed and seventy-nine injured by these disasters, many of which are undoubtedly due to avoidable causes. More than one-third of the recorded explosions took place on shipboard; but it is to be remembered that these accidents at sea are all reported to headquarters, while those on land, unless accompanied by loss of life, will often escape official notice. We are told that there is good reason to suppose that a great many explosions take place on land which are thus in a sense hushed up, to save trouble and inquiry. It is lamentable to see that one-half of the explosions were due to the use of defective or worn-out boilers, defective construction and undue pressure being responsible for nearly one-third, while the remainder of the disasters must be credited to ignorance and recklessness. It is noteworthy that no fewer than seven explosions were those of tramway boilers, and seem to have been due to one cause—namely, 'the wasting of the brass tubes from the action of gases from coke-fuel, and the scouring effect of ashes and cinders.' The Report calls special attention to this circumstance, and advises that those having such boilers at work should be alive to the necessity of frequently drawing a few of these tubes for examination.

The American Screw Company have recently perfected a machine by which the ordinary screws used by carpenters can be produced with much greater facility than by older methods; and a demonstration of the working of the new machine has recently taken place in London, while at the same time its advantages were proved by first of all producing some screws by the usual system. The old-fashioned machine was shown to cut the screws at the rate of seven per minute, while the new contrivance showered them forth at the rate of fifty-four in the same time. In the new method the blanks are made by feeding steel wire into a machine which turns them out rapidly, and furnishes them with a head, a slot for the screw-driver, and a point. They are now provided with a screw-thread, not by cutting in a lathe as

at present, but by being passed between two fluted rollers. By this new method there is no waste of metal and no weakness caused by cutting, besides which the screws produced by the process possess several structural advantages. A new screw called a 'Drive Screw' was also shown on the same occasion. This has a very quick thread, and can be driven in with a hammer, at each blow of which it makes a partial revolution. Such a screw can be withdrawn by an ordinary screw-driver, when it is seen that it is quite uninjured; the wood, too, when examined in section is seen to exhibit a perfect mould of the screw-thread. Further particulars of this invention can be obtained at 100c Queen Victoria Street, London, E.C.

Railway travelling, at anyrate on our great trunk lines, is so easy and comfortable that we forget that this modern mode of rapid transit means a vast amount of wear and tear both to the vehicles and the rails upon which they glide so smoothly. There is no apparent waste of metal, and nothing else to indicate at a glance that any wear and tear are going on; and yet it is estimated that on the North-Western system alone no less than eighteen tons of steel disappear daily! Part of this is by wear, and part by rust.

The 'Tower Company' (Limited), which has been called into existence by the financial success of the Eiffel Tower at Paris, are offering two prizes of five hundred guineas and two hundred and fifty guineas respectively for the best and second best design for a similar erection for the benefit of Londoners. The proposed tower is to be twelve hundred feet in height, which, by the way, is just three times the height of St Paul's Cathedral, and is to be furnished with lifts, like its prototype at Paris. The estimates sent in with the designs must show cost of all materials besides the cost of lifts and general building expenses. In case any of our readers should desire to enter into this competition, we may state that specifications can be obtained from the company at St Stephen's Chambers, Broadway, Westminster. It is to be presumed that the promoters of this enterprise must be aware that even on the finest day in London—except perhaps in the early morning, or under exceptional atmospheric conditions—the view from any high point in London is limited by the ever-present smoke. From the top of St Paul's, for instance, owing to this constant veil, the Houses of Parliament, which cannot be distant as the crow flies more than one mile, seem to be on the horizon, instead of comparatively close to the observer. In Paris, of course, the conditions are very different, and the fact of the Eiffel Tower being successful there is no argument in favour of the success of a similar scheme in London.

It is worthy of notice that the two steamships, or rather palaces, the *Tegtonia* and the *City of New York*, have recently beaten previous records in the time taken in crossing the Atlantic. This voyage is now completed in less than six days. The two vessels on the occasion referred to started within a few minutes of one another, and arrived at their journey's end almost at the same moment.

The name of James^d Prescott Joule was not a

familiar one to the general public, and the announcement of his recent death as that of one who was second only to the great Isaac Newton was apt to take many by surprise. Dr Joule had indeed long retired from public life, but his name was honoured by every student of science as one of our foremost discoverers. To explain in detail what gave him such a forward place in the world of science would occupy many of our pages. But his life's work is well described in brief form in the reasons given by the Society of Arts for conferring upon him in 1880 the Albert medal. It was awarded to him 'for having established, after most laborious research, the true relation between heat, electricity, and mechanical work, thus affording to the engineer a sure guide in the application of science and industrial pursuits.'

The method of sterilising milk, known as the Dahl process, after the name of its inventor, the late Mr K. G. Dahl of Norway, was recently demonstrated and explained in London. The treatment consists in storing fresh milk in hermetically sealed metal cans, which are then heated and cooled alternately until all organisms are destroyed. Milk which had been thus treated three years ago, and had since been kept sealed up in one of these tins, was opened and shown to be in every respect as good as fresh milk. The preserved milk can be readily turned into butter and cream, and it has the advantage of being unsweetened. For use on shipboard it will be valued; but perhaps its greatest benefits will be felt in the nursery, for it is certain that it can contain no source of infection. We understand that there is a project on foot for bringing this useful invention into prominent employment in this country.

TACT.

It is generally understood that to most women tact, like patience, is inborn, and that to few men is it even possible to acquire this valuable possession. Much may be said for and against this supposition. By some it is considered to be against the nature of even the best men to possess tact, so we are perhaps assured by such that many a worried woman would become placid and many a home free from unpleasantness if only the head of the house could be gifted with a little more of that useful quality which has been called a 'divine possession.'

To be able to say the right thing at the right moment is a great art, and said only to be acquired by those who have a natural talent that way. When a careless talker, who was criticising a young lady's father severely, paused a moment to say, 'I hope he is no relation of yours,' Miss B——?' quick as thought she replied, with the utmost nonchalance: 'Only a connection of mother's by marriage.'

Few could hope to show such clever readiness of speech in a dilemma of the kind. Yet in a more curious and amusing way this was almost matched by a cautious old woman, who, when asked what she thought of one of her neighbours of the name of Jones, with a knowing look replied: 'Why, I don't like to say anything

about my neighbours; but, as to Mr Jones, sometimes I think, and then again I don't know; but after all, I rather guess he'll turn out to be a good deal such a sort of man as I take him to be!

In a little episode of village life we had lately another interesting instance of feminine tact. Upon the conclusion of a marriage in a village church, the bridegroom signed his register with his X mark. The pretty young bride did the same; and then turning to a young lady who had known her as the best scholar in the school, whispered to her, while love and admiration shone in her eyes: 'He is a dear fellow, miss, but he cannot write. He is going to learn from me, and I would not shame him for the world.'

But it is not always so apparent that in the affairs of life women are more adroit, or show more discernment or better perception than men. Who has not noticed how often mothers and nurses, by continually uttering vague threats, which their little charges soon learn are never fulfilled, lose all authority—while one word from Paterfamilias acts like magic in restoring order and obedience amongst the young rebels? It is undeniable that concerning the love affairs of others women usually show much more perspicacity than men, and know how to act accordingly; yet often in their own cases the tact evinced by them in skillfully managing a lover would seem to be lost when that lover becomes a husband.

'Tact,' we are told, 'often thwarts strength,' and certainly may be made a wonderful instrument of conciliation and pacification. To be able readily and without premeditation to do or say the right thing is an enviable gift, one that has not unfrequently brought substantial rewards to its possessor. To ask a favour gracefully, or to compose a well-worded or delicately expressed missive in matters of diplomacy, would probably tax the mental resources of most of us.

To many men the art of at least putting things in a kind and complimentary way is not uncommon—an art that was well cultivated by the courtiers of days gone by. The painter who drew the terrible one-eyed Tamerlane in the attitude of a warrior taking aim with his bow, and consequently having one eye closed, is an illustration in point. Nor was the Spanish nobleman who sent Queen Elizabeth a looking-glass when asked by her majesty for the portrait of the lady who possessed so accomplished a cavalier's heart, a whit behind Raleigh himself in readiness and delicacy of tact.

A gentleman was heard to remark at a fashionable French gathering: 'At that time, Marchioness, I was in love'; then suddenly interrupting himself: 'But no doubt you are astonished that any one should fall in love before knowing you!' This, we admit, was rather an instance of excessive gallantry than of readiness such as was displayed by another Frenchman in the following: An old nobleman was lately accosted by an elderly lady with white hair at a party given by a Baroness. 'Don't you recognise me, Monsieur d'Aureville?' The gentleman was silent. 'It is many years,' she continued, 'since we met; I think in 1848?' 'Ah, madame,' exclaimed the nobleman, 'I have greatly changed since that time!' 'Could any one but a Frenchman have shaped such an answer?

It must have been a countryman of his who said: 'If you wish to pay a pretty compliment to a plain and ignorant woman, and at the same time do not wish to be guilty of a falsehood, tell her that she is as beautiful as she is accomplished. She will think you are a charming man, and your conscience will be guiltless of an untruth.' Such an adviser must be one of the very diplomatists of society.

In our part of the world Irishmen are credited with saying prettier things than the rest of us can. They have a certain assurance which enables them to blurt out the first thought that occurs to them, which is, of course, why they make bulls; but they score more happy conversational hits than more cautious people. Two young ladies and an Irish gentleman were conversing on age, when one of them put the home question: 'Which of us do you think is the elder, Mr G——?' 'Sure,' replied the gallant Irishman, 'you both look younger than each other.'

It is characteristic of some good-natured men always to agree with those with whom they converse. It is with them a point of politeness never to differ, which sort of politeness is certainly a very amiable kind of tact. We have a capital instance of the value of this policy in the sensible speech of the man who, during one of the Belfast riots, was asked by a mob what his religion was. He didn't know whether his interrogators were Catholics or Protestants; but he looked at their weapons, their bludgeons, and their firearms, surveyed all carefully, and answered: 'Gentlemen, I am of the same opinion as that gentleman there with the big axe.'

True courtesy, which has been called 'the beauty of the heart,' sometimes suggests, even to the uneducated, graceful ways of putting their words that excite wonder and admiration. 'Are you not very cold, my poor boy?' said a sympathetic young lady to a shivering shoeblack. 'I was till you smiled, miss,' was the clever and flattering reply.

In conversation, true courtesy is often forgotten in the general anxiety of people to speak rather than to listen; they may seem to be attentive, but the absent look in the eyes betrays the reverse. Good listeners, especially if youthful, are thought worlds of by garrulous old people. We should not reply to a recital of the troubles of others by a long list of grievances of our own; nor when shown anything in which the owner takes pride, spoil the effect by ungraciously referring to something superior in the same line which one has seen or may possibly possess. A constant endeavour to be easily pleased is essential to politeness, and when annoyances arise, then is the value of tact seen at its best in preventing general discomfort. Especially is this valuable acquisition or attribute useful when we have to find fault—always a difficult thing to do well—when the effect is lost, or, worse still, may be really injurious because of the way in which it is done.

The habit of thought before speech is not easy to acquire; and in conclusion we may add that tact, though partly a natural gift, is a good deal indebted to education and early habits. The superiority of one sex over the other in this respect will after all often be found to depend on art quite as much as upon nature.

THE STORY OF A YEAR.

A LITTLE Child in raiment white
Was sent to me one day
With message from the King of Light :
'Thy 'care I will repay,
If thou wilt keep her garment bright
Along the narrow way.'

We wandered forth, the Child and I ;
But soon, all careless grown,
I heeded not her plaintive sigh,
As, hurt by thorn and stone,
Or chilled by snowdrifts piled on high,
She uttered weary moan.

We wandered on ; more fair the land,
Sweeter the fragrance round.
I clasped again her little hand,
And sped o'er dewy ground,
Headless of clouds the sky that spanned,
Or wild beasts lurking round.

Still on we went, through gorgeous ways,
O'er sunny vale and hill,
While all too swiftly passed my days
By gleaming brook and rill,
And I forgot in noontide's blaze
To guard the Child from ill.

Still on we went. Cold blew the blast
In autumn's morning gray ;
My longing gaze behind was cast
Where flowery meadows lay,
And brooding o'er the vanished past,
I took my careless way.

'Farewell, farewell ; I c'en must go,'
A voice said in my ear :
'The distant hills are white with snow ;
My last dawn draweth near.
With garments torn and brow of woe
I go—a wasted Year.'

Startled, I turned, and looked around :
No Child's form met my gaze ;
But one, low bending to the ground,
Weary with weight of days,
Whose lips could utter forth no sound
Of thankfulness or praise.

Ah me ! how could I meet the King
Who gave her to my care ?
Lost were the gifts she came to bring,
And soiled her raiment fair.
Here, with the Old Year vanishing,
I could but kneel in prayer.

JESSIE C. DENT.

*Volume VI. of the Fifth Series of CHAMBERS'S JOURNAL is now completed, price Nine Shillings.
A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.
A cloth case for binding the whole of the numbers for 1889 is also ready.
Back numbers to complete sets may be had at all times.*

The next Monthly Part, published at the end of JANUARY, begins the new Volume for 1890,
and will contain the opening Chapters of a Novel of powerful interest, entitled,

MY SHIPMATE LOUISE.

By W. CLARK RUSSELL,

AUTHOR OF 'THE WRECK OF THE GROSVENOR,' &c.
